EXPLORATION UPDATE

Noondie Uranium Project

A total of 55 water samples have now been collected from the Lake Noondie Project area drilling and from bores. The Noondie area is located 60km south-east of Sandstone and is covered by four exploration licences totalling 250km² in area, all of which are now granted.

The new water results highlight a tributary palaeochannel in the eastern part of the project area that has values in excess of 100ppb U in water (max 170ppb), well above the threshold values of 100ppb indicated by a Yeelirrie model. The results define a target of some 13km length for follow-up reconnaissance drilling.

Water sampling results from the drilling in the main Lake Noondie channel reach 70ppb U in water and their distribution appears to correlate well with the earlier surface sampling. Further exploration will look for a source further upstream to the west.

Noondie is part of a wider uranium portfolio held by Mindax that includes Panhandle on Lake Barlee and the extensive Yilgarn-Avon project area.
