## LITTLE EVA COPPER-GOLD DEPOSIT CONTINUES TO DELIVER

**Altona Mining Limited** ("Altona") today announce further excellent drilling results from a reverse circulation (RC) drilling programme underway at the 100% owned Roseby Copper Project ("Roseby") near Mt Isa in Queensland, Australia.

On 26 July 2011 Altona announced a major increase in the size of the Little Eva Resource.

The declared resource for the Little Eva Deposit is 74.7Mt at a grade of 0.52% copper and 0.1g/t gold for 388,000t contained copper and 205,000oz contained gold (Appendix 3).

Altona has now completed some 11,000 metres (53 holes) of the drilling programme and drilling continues with the aim of completely delimiting the Little Eva Resource to the likely depth limit of open pit mining (250-300m). Sufficient drilling will be undertaken to ensure that the majority of resources that fall within a pit design report to the Measured and Indicated categories.

Further excellent thick drill intersections from 36 drill holes were returned, with highlights including:

**LER 589: 270m @ 0.54% copper, 0.10g/t gold from 0m**  
**LER 588: 225m @ 0.64% copper, 0.12g/t gold from 0m**  
**LER 556: 121m @ 0.56% copper, 0.03g/t gold from 137m**  
**LER 564: 55m @ 0.64% copper, 0.06g/t gold from 40m**  
**LER 585: 63m @ 0.54% copper, 0.06g/t gold from 128m**  
**LER 584: 42m @ 0.59% copper, 0.03g/t gold from 68m**  
**LER 566: 34m @ 0.71% copper, 0.09g/t gold from 157m**

A full tabulation of the drilling results is given in Table 1 (Appendix 1).

These drill holes were not included in the recent resource upgrade. They were mainly targeted at defining the low-grade extensions of the deposit to the south-east and at higher grade extensions along the current western boundary of the deposit. In order to define extensions to the edges of such a massive deposit some drill holes pass through (in-part) existing defined resources.

The location of Little Eva is given in Figure 1. The focus of the drilling campaign is shown in Figure 2.

A further upgrade to the Little Eva resource will follow in coming months.

## **Competent Persons Statement**

The information in this report that relates to Exploration Results, Mineral Resources or Ore Reserves is based on information compiled and reviewed by Dr Alistair Cowden BSc (Hons), PhD, MAusIMM, MAIG and Mr Maurice Hoyle BSc, FAusIMM, MAIG, MSEG who are full time employees of the Company and have sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which they are undertaking to qualify as Competent Persons as defined in the 2004 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Cowden and Hoyle consent to the inclusion in the report of the matters based on their information in the form and context in which it appears.

## **About Roseby**

The Roseby Copper Project is 100% owned by Altona Mining Limited and is one of Australia's largest undeveloped copper resources. A Definitive Feasibility Study (DFS) completed in 2009 envisaged the production of 26,000 tonnes per annum of copper, and 7,500 ounces per annum of gold for 10 years from a 5Mtpa open pit-mining operation. Environmental and regulatory approvals for construction of this substantial mining operation are well advanced. A new DFS targeting a larger operation is scheduled for completion in 2012.

The Roseby Project is over 1,400km<sup>2</sup> in size and is a major strategic land holding being only 95km northeast of the major mining centre of Mt Isa in northwest Queensland.

The Mt Isa area is one of the world's foremost base metal mining provinces. It is estimated that the area hosts approximately 11% of the world's zinc, 5% of its silver and 1% of its copper.

Despite the large copper and gold Resources that have already been declared, the Project remains highly prospective and under-explored. In addition to excellent copper and gold exploration potential, the project is prospective for the discovery of uranium, molybdenum, rare earth elements (REE) and zinc deposits.

\*Please note that in the ASX release dated 28 June 2011 drill-holes LER 552 and 553 were incorrectly reported.

## APPENDIX 2: DETAILS OF DRILLING PROGRAMME AND SAMPLING, ASSAYING

### Drilling

LER series holes were RC hammer drilled so as to produce maximum sample return with a minimum of contamination.

Drilling was performed using a Swick configured Schramm T685 Reverse Circulation drill rig with face sampling hammer. Auxiliary air compressor and booster, with a minimum capacity of 1000psi and 2700cfm, were utilized for sample return and dryness. All holes were drilled at 5.5 inch diameter.

RC drill chips were collected in one metre intervals at the rig using a rotary splitter. Each sample consisted of approximately 2kg of material, which was submitted for assay.

LED series holes are NQ2 diamond drill holes drilled in 2005 for geotechnical purposes and never previously assayed

### Assay Methods

Assaying was undertaken at Australian Laboratory Services (ALS) Townsville. Copper, Silver and Sulphur were determined by method ME-ICP41 (Aqua Regia digest with ICP-AES). Gold was determined by method Au-AA25 (30g fire assay with AAS). Samples with greater than 1% copper were re-analysed using an ore grade Aqua Regia and ICP-AES method (Cu-OG46).

Reference standards and blanks were inserted into the sample stream in the ratios 1:18 and 1:40 respectively. Field duplicates were collected with every 20th sample by taking a second split at the rig.

### Data Aggregation

Significant intercepts calculated using a 4m minimum intercept, 4m maximum internal waste and lower cut-off grades of 0.15% and 0.3% copper.

### Copper Equivalence

Copper equivalence was calculated on the basis of copper recoveries of 95%, gold recoveries of 94%, copper price of US\$3.85/lb and a gold price of US\$1400/ounce. The ratio of the value of 1% recoverable copper to recoverable 1 gram gold is 6.4 and was used to estimate the recovered value expressed as a copper grade.

### APPENDIX 3: RESOURCE ESTIMATES FOR THE ROSEBY PROJECT

Summary of Mineral Resource Estimates for the Roseby Project

DEPOSIT	STATUS	TOTAL			CONTAINED METAL		MEASURED			INDICATED			INFERRED		
		Tonnes	Grade		Copper	Gold	Tonnes	Grade		Tonne	Grade		Tonnes	Grade

- A - Estimates made by McDonald Speijers and disclosed in ASX release dated 26 July 2011. Note that gold grades for native copper mineralisation have been set at zero as grades estimated are at detection limits and any implied gold content is an artifice of the resource modelling process.
- B - Estimates made by Altona and reported in ASX release dated 26 July 2011.
- C - Estimates made by Altona and disclosed in ASX release dated 20 January 2006.

Note: All figures may not sum exactly due to rounding.
