HIGH-GRADE COPPER CONFIRMED IN ANALYTICAL RESULTS FROM HISTORIC DRILL CORE AT MOUNT HARDY

Widespread copper mineralisation confirmed

Highlights:

Laboratory assay results received for 249 samples from re-sampling historic drill core from the Mount Hardy “Mine” prospect, with best results including:

**10.7m @ 4.1% Cu from 6.9m, including 1m @ 27% Cu
7.0m @ 1.64% Cu from 37.5m, including 3m @ 5.7% Cu
2.6m @ 1.69% Cu from 23.5m,**

Copper mineralisation recorded in all 7 historic diamond drill holes.

Primary copper mineralisation noted in drill core, including visible native copper and chalcocite.

Results confirm that copper mineralisation extends from surface to a maximum depth of 122m at the Mount Hardy “Mine” Prospect.

Prospect tested by historic drilling over a strike length of just 150m within an anomalous zone extending over 500m.

Drill results from other EM Targets tested as part of the recently completed RC drilling program at Mount Hardy to be reported shortly.

Australian resources company TNG Limited (ASX: **TNG**) is pleased to report significant new results from re-sampling and assaying of historic diamond drill core from the Mount Hardy “Mine” prospect at its 100%-owned Mount Hardy Copper Project in the Northern Territory.

Best intersections are summarised below:

| Hole Number | From | To | Thickness (m) | Cu% |
|------------------|------|-------|---------------|------|
| 68MHDDH002 | 23.5 | 26.1 | 2.6 | 1.69 |
| 68MHDDH003 | 37.5 | 44.5 | 7.0 | 1.64 |
| <i>Including</i> | 38.7 | 42.06 | 3.3 | 5.7 |
| 68MHDDH004 | 6.9 | 17.5 | 10.7 | 4.1 |
| <i>Including</i> | 15.8 | 17.06 | 1.2 | 10.6 |
| | 9.44 | 10.9 | 1.5 | 27.2 |
| 68MHDDH005 | 5.2 | 10.1 | 4.9 | 0.98 |
| 68MHDDH006 | 16.0 | 19.2 | 3.2 | 1.95 |
| 68MHDDH007 | 89.6 | 107.0 | 17.4 | 0.53 |

The results provide further evidence that the Mount Hardy Project contains widespread copper mineralisation, further enhancing the prospectivity of the area and confirming the potential of the Project to become a significant asset for TNG in 2013.

TNG LIMITED

The Mount Hardy “Mine” Prospect is located approximately 2.5km east of the EM#1 Target, where TNG recently reported the presence of copper sulphides in the first RC drill hole (see ASX Release – 21 November 2012).

In 1968, seven diamond drill holes were drilled into the “Mine” Prospect by the Bureau of Mineral Resources (BMR) over a restricted strike length of just 150m (see *Figure 1, Table 2.*). TNG conducted significant rock sampling over this prospect and verified the presence of surface copper mineralisation with surface samples returning copper results of up to 6.84% Cu (see ASX Release – 10 October 2012),

TNG subsequently located the BMR drill core at the Department of Resources core storage facility in Alice Springs, where it has been well preserved. The core was logged, cut and dispatched for laboratory assay. These results have been added to the original BMR assays (see appendix 1).

Significant intervals of oxide mineralisation extend down to primary copper sulphide mineralisation to a depth of 122m. In places this remains open at depth. Primary copper sulphides were noted in the logging by TNG geologists, including Native copper, chalcocite and chalcopyrite, see plate 1. Extensive intersections of malachite and chalcopyrite were also noted, see plate 2,3.

←Plate 1: Native Copper and malachite, DDH 7

Plate 2: Chalcopyrite in vein quartz, DDH 7 →

← Plate 3: Malachite on oxidised vein quartz, DDH 4.

TNG LIMITED

Results and details of the mineralisation are summarised in Table 1.

Previous results from surface rock and soil sampling of this prospect were reported to the ASX on September 26th 2012, October 2nd 2012 and October 10th 2012. 24 samples were collected from a costean where continuous channel chip samples were taken (mostly over two metre intervals) to provide 51 metres of continuous sampling across strike over two main vein lines.

Results from the rock sampling gave a single zone returned **6 metres @ 3.39% Cu** from 39-45 metres. Two zones were outlined returning 8.0 metres @ 0.51% Cu from 21-29 metres, and **12.0 metres @ 2.00% Cu** from 39-51 metres (open to the south). Results from soil sampling confirmed the copper anomalism extended to the west for approximately 500m and this remains untested at depth (refer ASX September 26th 2012).

The results of the BMR core samples have confirmed the extension of the surface mineralisation at depth over a minimum strike length of 150m. The soil and rock geochemical sample results show the surface anomaly for copper extends for at least 500m and was not tested by the BMR drilling, providing a significant future target at this prospect.

Next Steps at Mount Hardy

A new geophysical programme including Induced Polarisation (IP) for detection of disseminated sulphides and detailed gravity for accurate mapping structures will be undertaken at Mount Hardy in Q1 of 2013.

A down-hole electromagnetic (DHEM) survey has been prepared and will be completed prior to year end subject to crew availability.

All remaining RC results have also now been received and are currently being assessed in conjunction with the geophysics. These will be reported separately.

TNG's Managing Director, Mr Paul Burton, said Mount Hardy was emerging as a significant exploration and development opportunity for the Company.

"We now have clear evidence of potentially significant widths and grades of copper mineralisation, including native copper from historic drilling at the Mount Hardy 'Mine' Prospect, which is just one of several target areas at Mount Hardy which we intend to test further in the coming weeks and months," Mr Burton said.

COMPETENT PERSON STATEMENT

The information in this report that relates to Exploration Results and Exploration Targets are based on information compiled by Exploration Manager Mr Kim Grey B.Sc. and M. Econ. Geol. Mr Grey is a member of the Australian Institute of Geoscientists and a full time employee of TNG Limited. Mr Grey has sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2004 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Grey consents to the inclusion in the report of the matters based on his information in the form and context in which it appear.

| and | 121.620 | 122.530 | 0.910 | 0.490 | |
| Total @ 0.3% Cu Cut-off | 89.610 | 106.990 | 17.380 | 0.530 | Broad zone of primary chalcopyrite mineralisation |

All samples collected by TNG were submitted for multi-element determination by inductively coupled plasma (ICP) analyses, with gold, platinum and palladium by fire assay. Results over the upper detection limits of 1% for copper, were subsequently re-assayed using Ore-Grade analyses with an ICP determination. All samples were crushed and pulverized to >85% <75um.
