RC Drilling Programme Completed at the Woodie Woodie West Manganese Project

Montezuma Mining Company Ltd (“Montezuma”) is pleased to advise that targets resulting from a recent Dipole-Dipole Induced Polarisation (DDIP) ground based geophysical program undertaken at the Woodie Woodie West Manganese Project have been tested by RC drilling. Visible manganiferous mineralisation was not intersected and the IP anomalies have been explained by the presence of wet clays in the weathered profile.

The drilling programme, however, intersected dolomitic rocks which are tentatively interpreted as the Carrawine Dolomite, the upper contact zone of which is the primary host of manganese mineralisation at the adjacent Woodie Woodie Manganese Mine.

Confirmation of this interpretation through geochemical analysis will enhance the prospectivity of the tenement, and a geological review of the drillhole data will be undertaken to determine the next step in advancing the Project.

Details of the location of the drillhole collars appear in the table below.
