# Significant results reveal continuous 2km-long deposit at Kundana

Latest drilling shows the three K2 deposits join at depth, highlighting potential for Kundana to improve on its 100,000-110,000ozpa production forecasts for many years

### **KEY POINTS**

- Latest drilling at the East Kundana JV near Kalgoorlie indicates that the three mining centres on the K2 structure (Pegasus, Rubicon and Hornet) all join at depth, creating a 2km-long orebody
- ► The outstanding results suggest Kundana could produce more than the forecast 100,000-110,000ozpa contribution to the 700,000ozpa target Northern Star has set for 2018
- Latest results from Pegasus include:
  - 1.1m at 131.0gpt (est true width 0.4m)
  - 3.4m at 19.9gpt (est true width 0.9m)
  - 16.0m at 4.5gpt (est true width 12.0m)
- Latest results at Rubicon include:
  - 4.0m at 44.2gpt (est true width 1.6m)
  - 2.3m at 34.1gpt (est true width 1.6m)
  - 2.5m at 29.3gpt (est true width 1.8m)
- Latest results at Hornet include:
  - 49.0m at 8.6gpt (est true width 25.0m)
  - 6.3m at 18.2gpt (est true width 4.7m)
  - 38.8m at 5.8gpt (est true width 30.0m)
- New drilling results at the Raleigh mine (1.1Moz at 13.9gpt mined to date) indicate the orebody remains open at depth and to the south with potential for substantial extensions to mine life. Latest results include:
  - 0.3m at 1,400gpt (est true width 0.2m)
  - 1.0m at 241.4gpt (est true width 0.7m)
  - 0.3m at 800gpt (est true width 0.2m)
- Significant drilling results from the Pode structure (which is a splay off the Pegasus deposit and is not in the current Pegasus mine plan). Results include:
  - 17.0m @ 17.0gpt (est true width 15.0m)
  - 4.2m @ 47.0gpt (est true width 2.6m)
- New high-grade structure, Falcon, discovered just 300m west of Pegasus. Significant hits include:
  - 9.3m @ 27.9gpt (est true width 7.0m)
  - 5.1m @ 17.4gpt (est true width 4.0m)
- Significant capital investment in Kundana is delivering substantial operational gains with a record of 64,534oz<sup>1</sup> mined in the March Quarter

<sup>&</sup>lt;sup>1</sup> Northern Star Resources Limited (ASX: NST) (51%), Rand Mining Ltd (ASX: RND) (12.25%) and Tribune Resources Ltd (ASX: TBR) (36.75%) respectively.

Northern Star Resources Limited (ASX: NST) is pleased to advise that three of the major deposits at the East Kundana Joint Venture (Northern Star 51%) near Kalgoorlie are connected at depth, forming a continuous 2kmlong orebody. Joint Venture Partners, Rand Mining Ltd (ASX: RND) and Tribune Resources Ltd (ASX: TBR) own the remaining 49%, with 12.25% and 36.75% respectively.

This major development stems from the latest high-grade drilling results at the Pegasus, Rubicon and Hornet deposits on the K2 structure at Kundana.

The discovery has significant implications because it means Kundana is now poised to exceed its production forecast of between 100,000-110,000ozpa for many years.

Northern Star is in the throes of increasing its total production from  $\sim$ 570,000ozpa currently to 700,000ozpa by 2018. It has earmarked its 51 per cent share of Kundana to contribute 105,000ozpa to this total.

Kundana exceeded this target comfortably in the March quarter, with a record of 64,534oz mined for the 100% total EKJV. The EKJV results for the month of March were particularly strong, with 27,872oz mined, 20,381oz milled and 28,697oz left on stockpiles, up from 21,207oz at the end of February.

Northern Star Managing Director Bill Beament said confirmation that the three K2 deposits were joined at depth would lead to substantial increases in production and mine life at Kundana.

"We have three of the highest grade deposits in Australia, which are already outstanding in their own rights, linking up at depth to form a continuous 2km-long orebody," Mr Beament said.

"The implications of this for Kundana and Northern Star are significant. And when we take into account the latest significant results from elsewhere at Kundana, including in the Pode and the newly discovered Falcon structure, it becomes clear that this world-class project will make a growing contribution towards us meeting our 700,000ozpa target by 2018."

In recognition of the continuity of the orebody at depth, a proposed drill-drive is being designed to enable drill coverage at depth from underground (Figure 1). This key infrastructure will enable a significant zone between the Pegasus, Rubicon and Hornet deposits to be drill-tested. This area will also be excavated to provide production access.

A proven strategy for achieving production growth at Kundana has involved having the flexibility to produce from multiple stoping fronts. This drill-drive approach will enable that to occur.

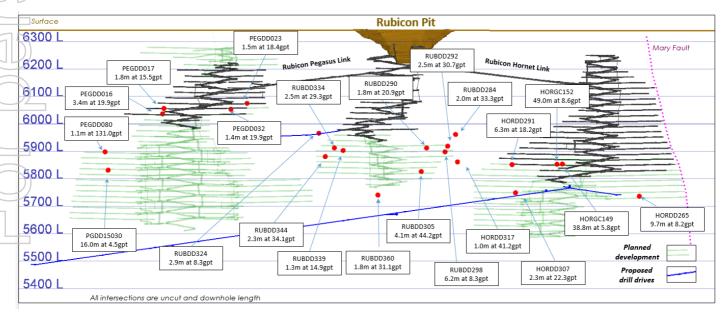

Figure 1: Pegasus - Rubicon - Hornet - Significant drilling results

The prospect of further production growth at Kundana has been further strengthened by new drilling results from the Raleigh mine which indicate that the orebody is open at depth and to the south.

ASX: NST Page 2 of 16

The results, which include 0.3m at 1,400gpt, 1.0m at 241.4gpt and 0.3m at 800gpt, point to the potential of a significant expansion of the existing Raleigh mineral inventory (Figure 2).

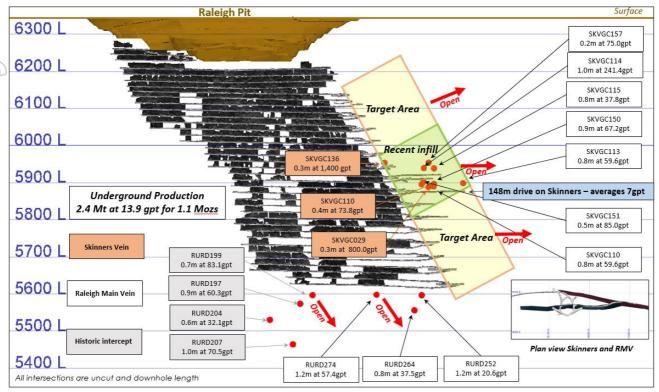

Figure 2: Raleigh and Skinners Vein - Significant drill intersections

Drilling on the Pode structure, which is a splay off the Pegasus deposit, returned high-grade results with potential for additions to the mineral inventory (Figure 3). The hits at Pode include 17m at 17gpt and 4.2m at 47.0gpt.

The latest drilling also located a new structure, called Falcon, located just 300m from the Pegasus deposit, with results including 7m at 27.4gpt and 3m at 50.4gpt (Figure 3).

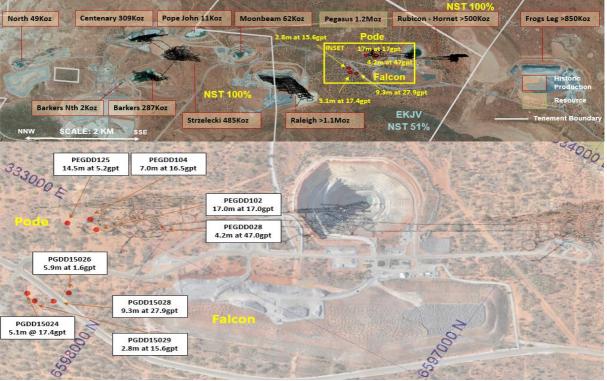

Figure 3: Pode and Falcon - Significant drill intersections

ASX: NST Page 3 of 16

Mr Beament said drilling was continuing at Kundana with a view to calculating an updated Resource-Reserve estimate by mid-year.

Yours faithfully

BILL BEAMENT
Managing Director

Bill Beament

#### Competent Persons Statements

The information in this announcement that relates to exploration results, data quality and geological interpretations, is based on information compiled by Darren Cooke, a Competent Person who is a Member of the Australian Institute of Geoscientists and a full-time employee of Northern Star Resources Limited. My Cooke has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves" for the Company's EKJV Project area. Mr Cooke consents to the inclusion in this announcement of the matters based on this information in the form and context in which it appears.

#### Forward Looking Statements

Northern Star Resources Limited has prepared this announcement based on information available to it. No representation or warranty, express or implied, is made as to the fairness, accuracy, completeness or correctness of the information, opinions and conclusions contained in this announcement. To the maximum extent permitted by law, none of Northern Star Resources Limited, its directors, employees or agents, advisers, nor any other person accepts any liability, including, without limitation, any liability arising from fault or negligence on the part of any of them or any other person, for any loss arising from the use of this announcement or its contents or otherwise arising in connection with it.

This announcement is not an offer, invitation, solicitation or other recommendation with respect to the subscription for, purchase or sale of any security, and neither this announcement nor anything in it shall form the basis of any contract or commitment whatsoever. This announcement may contain forward looking statements that are subject to risk factors associated with gold exploration, mining and production businesses. It is believed that the expectations reflected in these statements are reasonable but they may be affected by a variety of variables and changes in underlying assumptions which could cause actual results or trends to differ materially, including but not limited to price fluctuations, actual demand, currency fluctuations, drilling and production results, reserve estimations, loss of market, industry competition, environmental risks, physical risks, legislative, fiscal and regulatory changes, economic and financial market conditions in various countries and regions, political risks, project delay or advancement, approvals and cost estimates.

#### JORC Code, 2012 Edition – Table 1 Report: Kundana Drill Results reported 6 April 2016

(Rubicon, Hornet, Pegasus, Falcon, Raleigh and Skinners Vein)

#### Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.	Sampling was completed using a combination of Reverse Circulation (RC) and Diamond Drilling (DD). Sample intervals are defined by the geologist to honour geological boundaries.  Diamond drill core was aligned, measured and then sampled by cutting the core in half longitudinally using an "Almonté" diamond saw. Cutting was along orientation lines which are retained in the tray or, where orientation lines are absent, along cutting lines marked on the pieced together core.
	Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.	Diamond core was transferred to core trays for logging and sampling. Where significant changes in geology were encountered, the sample boundary was marked there Half core samples were nominated by the geologist from both NQ2 and HQ diamond core, with a minimum sample width of either 20cm (HQ) or 30cm (NQ2).  RC samples were split using a rig-mounted cone splitter on 1 m intervals to obtain a sample for assay. 4m Composite spear samples were collected for most of each hole, with 1 m samples submitted for areas of known mineralisation or anomalism.
	Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.	The main assaying method employed by the company is normal fire assay with a 40 or 50g charge and AAS analysis for Au. All sampling data was entered onto logging sheets or tablet computer and entered into the central Acquire database. Some historic RC holes from surface and the pit were also used for resource estimation. These holes typically have 2m sample intervals.
Drilling techniques	Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc.).	Both RC and Diamond Drilling techniques were used at the K2 deposits.  Diamond drill holes completed pre-2011 were predominantly NQ2 (50.5mm). All resource definition holes completed post 2011 were drilled using HQ (63.5mm) diameter core  Where appropriate diamond core was orientated using a spear, Ballmark <sup>TM</sup> , Ezimark <sup>TM</sup> , or ACE multi electronic tool  RC Drilling was completed using a 5.75" drill bit, downsized to 5.25" at depth.
Drill sample recovery	Method of recording and assessing core and chip sample recoveries and results assessed.	RC drilling contractors adjust their drilling approach to specific conditions to maximize sample recovery. Moisture content and sample recovery is recorded for each RC sample. No recovery issues were identified during 2015 RC drilling. Recovery was poor at the very beginning of each hole, as is normal for this type of drilling in overburden.
	Measures taken to maximise sample recovery and ensure representative nature of the samples.	For diamond drilling the contractors adjust their rate of drilling and method if recovery issues arise. All recovery is recorded by the drillers on core blocks. This is checked and compared to the measurements of the core by the geological team. Any issues are communicated back to the drilling contractor.
	Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.	Recovery was generally excellent for diamond core and no relationship between grade and recovery was observed. Some core loss was observed in the Skinners Vein, this has led to an under call on mineralisation.  For RC drilling, pre-collars were ended before known zones of mineralisation and recovery was very good through any anomalous zones, so no issues occurred.
Logging	Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.	All diamond core was inspected by geologists; lithology, mineralisation, structure, alteration, veining and specific gravity were recorded. Quantitative measures were also recorded where possible such as structural measurements, intensity of alteration, percentage of mineralisation, thickness of veins and veins per metre. Geotechnical measurements on diamond core include RQD, Recovery, and Fracture Frequency. Photographs are taken of each core tray when wet. All mineralised intersections are logged and sampled
	Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc.) photography.	All logging is quantitative where possible and qualitative elsewhere. A photograph is taken of every core tray. Visual estimates are made for mineralisation percentages for core.
	The total length and percentage of the relevant intersections logged.	RC sample chips are logged in 1m intervals. For the entire length of each hole. Regolith, Lithology, alteration, veining and mineralisation are all recorded.
	If core, whether cut or sawn and whether quarter, half or all core taken.	All Diamond core is cut and half the core is taken for sampling. The remaining half is stored for later use.

ASX: NST Page 12 of 16

	Criteria	JORC Code explanation	Commentary
$\geqslant$	Sub-sampling techniques and sample preparation	If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry.	All RC samples are split using a rig-mounted cone splitter to collect a 1m sample 3-4kg in size. These samples were submitted to the lab from any zones approaching known mineralisation and from any areas identified as having anomalous gold. Outside of mineralised zones spear samples were taken over a 4m interval for composite sampling.
	Quality of assay data and laboratory tests	For all sample types, the nature, quality and appropriateness of the sample preparation technique.	The sample preparation is considered appropriate
		Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.	Field duplicates were taken for RC samples at a rate of 1 in 20
5		Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate / second-half sampling.	Quarter core sampling is often undertaken as a check
10		Whether sample sizes are appropriate to the grain size of the material being sampled.	Grind checks are performed at both the crushing stage (3mm) and pulverising stage (75µm), requiring 90% of material to pass through the relevant size.
		The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.	All samples are prepared and assayed at commercial laboratories. No Northern Star personnel are involved in the preparation or analysis procedures. Preparation involves crushing/pulverising the entire sample to 95% minus 75µm, splitting off 200g, and preparing a 50g charge for fire assay. Kanowna Belle samples are tested by fire assay with an atomic absorption finish (FA/AA) for Au, LECO for S and inductively coupled plasma (ICP) for As and other multi-elements.
5	)		Monthly QAQC reports are prepared to check for any bias or trends with conclusions discussed with the laboratory management. Holes that do not pass QAQC are not used for resource estimation.
		For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.	No geophysical tools were used to determine any element concentrations
	Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.	Sampling and assaying QAQC procedures include:  Periodical resubmission of samples (umpires) to primary and secondary laboratories in Kalgoorlie (minimum >5%).  Submittal of independent certified reference material  Review of internal laboratory quality control standards  Review of laboratory (analytical) duplicates  Sieve testing to check grind size  Sample recovery checks.  Unannounced laboratory inspections  Standard control samples and blanks are inserted into the sample stream at a ratio of 1:20. The samples are purchased from certified commercial supplier, encompassing a range of Au values. The standard control samples are changed on a three month rotation. The results are reviewed on a per batch basis and batches of samples are re-analysed if the result is greater than three standard deviations from the expected result. Any result outside of two standard deviations is flagged for investigation by a geologist and may also be re-assayed.  Primary laboratory Bureau Veritas meets ISO 9001:2000.	
	Verification of sampling and assaying	The verification of significant intersections by either independent or alternative company personnel.	All significant intersections are verified by another Northern Star geologist during the drill hole validation process, and later by a Competent person to be signed off
=	assaying	The use of twinned holes.	No Twinned holes were drilled for this data set
2		Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.	Geological logging was captured using excel templates. Both a hardcopy and electronic copy of these are stored, as well as being loaded in to the database using automatic acquire loaders. Assay files are received in csv format and loaded directly into the database by the Database administrator (DBA). A geologist then checks that the results have inserted correctly. Hardcopy and electronic copies of these are stored.
		Discuss any adjustment to assay data.	No adjustments are made to this assay data.
	Location of data points	Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.	A planned hole is pegged using a Differential GPS by the field assistants  Underground diamond holes are picked up by mine surveyors  During drilling single-shot surveys are every 30m to ensure the hole remains close to design. This is performed using the Reflex Ez-Trac system. Upon hole completion, a Gyroscopic survey is conducted by ABIMS, taking readings every 5m for improved accuracy. This is done in true north.
		Specification of the grid system used.	The final collar is picked up after hole completion by Differential GPS in the MGA 94_51 grid.

ASX: NST Page 13 of 16

	Criteria	JORC Code explanation	Commentary
		Quality and adequacy of topographic control.	Quality topographic control has been achieved through Lidar data and survey pickups of holes over the last 15 years.
$\geq$	Data spacing and	Data spacing for reporting of Exploration Results.	Drill hole spacing across each area varies though spacing was typically 40m x 40m or less.
	distribution	Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.	The data spacing is considered appropriate
		Whether sample compositing has been applied.	No compositing has been applied to these exploration results, although composite intersections are reported.
	Orientation of data in relation to geological structure	Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.	The majority of the structures in the Kundana camp dip steeply (80°) to WSW. The Pode structure has a much shallower dip in a similar direction, approximately 60°. To target these orientations the drill hole dips of 60-70° towards ~060° achieve high angle intersections on all structures.
		If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	No sampling bias is considered to have been introduced by the drilling orientation
	Sample security	The measures taken to ensure sample security.	All core is kept within the site perimeter fence on the Mining Lease 16/309. Samples are dispatched and/or collected by an offsite delivery service on a regular basis. Each sample batch is accompanied with a
	5		- Job number
			- Number of Samples
			- Sample Numbers (including standards and duplicates)
	1		- Required analytical methods
7	N .		- A job priority rating
70			A Chain of Custody is demonstrated by both Company and Bureau Veritas in the delivery and receipt of sample materials.
			Any damage to or loss of samples within each batch (e.g., total loss, spillage or obvious contamination), must also be reported to the Company in the form of a list of samples affected and detailing the nature of the problem(s).
	Audits or reviews	The results of any audits or reviews of sampling techniques and data.	No audits or reviews have been conducted recently on sampling techniques.

# Section 2 Reporting of Exploration Results (Criteria listed in the preceding section also apply to this section.)

<b>a</b>	Criteria	JORC Code explanation	Commentary
	Mineral tenement and land tenure status	Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.	The Hornet, Rubicon and Pegasus project are held by The East Kundana Joint Venture (EKJV). The EKJV is majority owned and managed by Northern Star Resources Limited (51%). The minority holding in the EKJV is held by Tribune Resources Ltd (36.75%) and Rand Mining Ltd (12.25%).
			The Hornet, Rubicon, Pegasus and Falcon deposits are hosted on M16/309
			The tenement on which the Hornet, Rubicon, Pegasus and Falcon deposits are hosted (M16/309) is subject to two royalty agreements; however neither of these is applicable to the actual Pegasus deposit. The agreements that are on M16/309 but not relevant to the Pegasus project are the Kundana-Hornet Central Royalty and the Kundana Pope John Agreement No. 2602-13.
			The Raleigh and Skinners deposits are located on M15/993. A small portion of the Raleigh orebody (Raleigh North) crosses on to M16/157
	7	The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.	No known impediments exist and the tenements are in good standing
	Exploration done by other parties	Acknowledgment and appraisal of exploration by other parties.	The first reference to the mineralisation style encountered at the Pegasus project was the mines department report on the area produced by Dr. I. Martin (1987). He reviewed work completed in 1983 – 1984 by a company called Southern Resources, who identified two geochemical anomalies, creatively named Kundana #1 and Kundana #2. The Kundana #2 prospect was subdivided into a further two prospects, dubbed K2 and K2A.
			Between 1987 and 1997, limited work was completed.
			Between 1997 and 2006 Tern Resources (subsequently Rand Mining and Tribune Resources), and Gilt-edged mining focused on shallow open pit potential which was not considered viable.
			In 2011, Pegasus was highlighted by an operational review team and follow-up drilling was planned through 2012.

Page 14 of 16 ASX: NST

Criteria	JORC Code explanation	Commentary
		This report is concerned solely with 2015-16 drilling that led on from this period.
		Raleigh was discovered by Goldfields Limited in the early 2000's
Geology	Deposit type, geological setting and style of mineralisation.	The Kundana camp is situated within the Norseman-Wiluna Greenstone Belt, in an area dominated by the Zuleika shear zone, which separates the Coolgardie domain from the Ora Banda domain.
		K2-style mineralisation (Pegasus, Rubicon, and Hornet) consists of narrow vein deposits hosted by shear zones located along steeply- dipping overturned lithological contacts. The K2 structure is present along the contact between a black shale unit (Centenary shale) and intermediate volcanoclastics (Spargoville formation).
		The southern extent of Hornet is truncated by the Mary Fault. Frog Legs deposit (owned by La Mancha) is the continuation of the K2 system
75		Minor mineralisation, termed K2B, also occurs further west, on the contact between the Victorious basalt and Bent Tree Basalt (both part of the regional upper Basalt Sequence).
		A 60° W dipping fault, offsets this contact and exists as a zone of vein-filled brecciated material hosting the Pode-style mineralisation.
		Raleigh is a laminated vein hosted on the Strzelecki structure, which is a discrete fault zone within the broader Zuleika Shear. Skinners vein is a near parallel splay in the hangingwall of the Raleigh main vein.
Drill hole Information	A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:	All holes relevant to this reporting period are detailed in the appendix
	o easting and northing of the drill hole collar	
	o elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar	
	o dip and azimuth of the hole	
(0)	o down hole length and interception depth	
	o hole length.	
	If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.	Some minor lower grade intersections, that are not part of the reported mineralised system, are not reported. This information is not material.
Data aggregation methods	In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.	All reported assay results have been length weighted to provide an intersection width. A maximum of 2m of barren material between mineralised samples has been permitted in the calculation of these widths.
	Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.	No assay results have been top-cut for the purpose of this report. A lower cut-off of 1 gpt has been used to identify significant results, although lower results are included where a known ore zone has been intercepted, and the entire intercept is low grade.
	The assumptions used for any reporting of metal equivalent values should be clearly stated.	No metal equivalent values have been used for the reporting of these exploration results
Relationship between mineralisation widths	These relationships are particularly important in the reporting of Exploration Results.	True widths have been calculated for intersections of the known ore zones, based on existing knowledge of the nature of these structures. For unknown structures, only the downhole length is reported.
and intercept lengths	If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.	Both the downhole width and true width have been clearly specified when used.
	If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').	For unknown structures, only the downhole length is reported.
Diagrams	Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	Appropriate plans and section have been included in the body of the announcement.
Balanced reporting	Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	Both high and low grades have been reported accurately, clearly identified with the drill hole attributes and 'From' and 'To' depths.
Other substantive exploration data	Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	No further relevant work has been carried out

ASX: NST Page 15 of 16

Criteria	JORC Code explanation	Commentary
Further work		Further work will continue in 2016 to extend the indicated resource deeper by additional drilling and identify new mineralised shoots on the K2 structure. In part this will be from a proposed 2km drill drive stretching from Hornet to Pegasus
_ <sup>′</sup>	Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.	Part of the announcement

ASX: NST Page 16 of 16
