

ASX RELEASE 27 March 2017

ASX: MGV

Drilling Identifies Southern Extension to High Grade Gold Lode at Break of Day

- Drilling at the southern end of the Break of Day deposit has extended the high grade gold mineralisation a further 25m to the south
- Drill hole 17MORC003 intersected 1m @ 117.4g/t gold from 173m down hole
- The high grade gold mineralisation is still open to the south and down plunge
- Further drilling is underway to test this southern extension
- Infill drilling at Break of Day has intersected high grade gold in drill hole 17MORC006
 - 2m @ 16.2g/t Au from 120m down hole
- Assay results are still awaited for a further 38 drill holes in the current program

Musgrave Minerals Ltd ("Musgrave" or "the Company") (ASX: **MGV**) is pleased to announce the receipt of assay results for a further two drill holes from the current 4,000m reverse circulation ("RC") drilling program at the Break of Day prospect on the Cue Project in the Murchison region of Western Australia (*Figure 1*).

Musgrave Managing Director Rob Waugh said, "This is another positive result with the high grade gold in 17MORC003 extending the Twilight Lode at Break of Day a further 25m south. The mineralisation is still open to the south (*Figure 2*) and down plunge which creates an opportunity for Musgrave to continue to extend this high grade gold mineralisation to grow the resource."

Musgrave has currently drilled 44 holes for a total of 4,006m in the current program. Assay results have now been received for 6 drill holes with results for the remaining 38 drill holes expected over the next six week period.

The objective of the drilling is to extend and infill the high grade gold mineralisation at both Break of Day and Lena to complete a new resource estimate in the second quarter of 2017. The new resource estimate will underpin studies to demonstrate a viable path to near term development.

BREAK OF DAY

Assay results for two drill holes from the recent drill program at Break of Day have been received.

Drill hole 17MORC003 intersected **1m** @ **117.4g/t Au** from 173m down hole and extends the high grade gold mineralisation on the Twilight Lode a further 25m south on section 13275mN (*Figures 2 and 3*). Drill hole 17MORC006 was drilled on section 13350mN and intersected **2m** @ **16.2g/t Au** from 120m down hole (*Figure 4*). Assays are awaited for an additional 38 drill holes at Break of Day and Lena.

There is significant potential to continue to improve the grade and increase the gold resources at Lena and Break of Day with further drilling.

The high grade gold mineralisation at Break of Day occurs in vertical to steep westerly dipping, semi-parallel quartz lodes hosting gold with minor (1-2%) pyrite, within a dolerite-basaltic stratigraphic sequence. The separation of the Twilight and Velvet gold lodes varies along strike from 15 to 60 metres. The gold mineralisation is currently open along strike and down plunge.

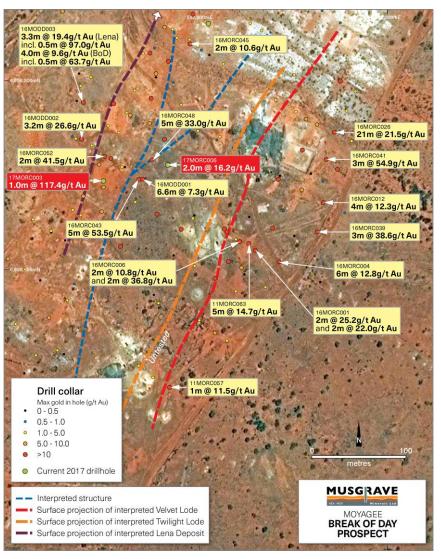

Figure 1: Location plan showing maximum gold in hole plotted at the drill hole collar for Break of Day and Lena gold prospects

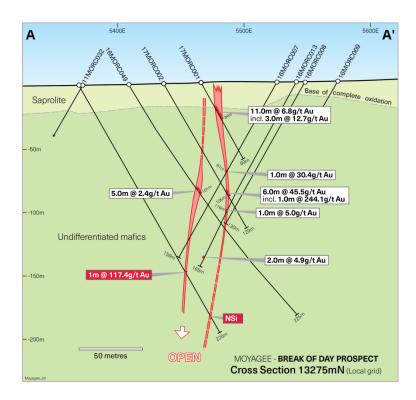

Figure 2: Break of Day cross section 13275mN – local grid (vertical section through mineralisation)

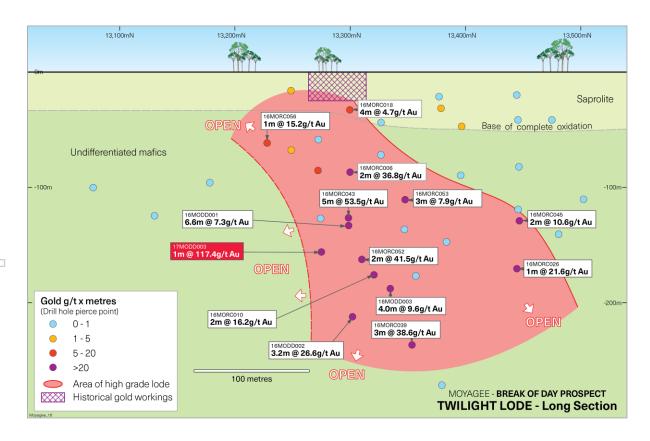

Figure 3: Break of Day long section of Twilight gold lode (a long section or longitudinal section is a section along the plane of the lode and in this instance shows gold grade x thickness variability with depth of the Twilight Lode)

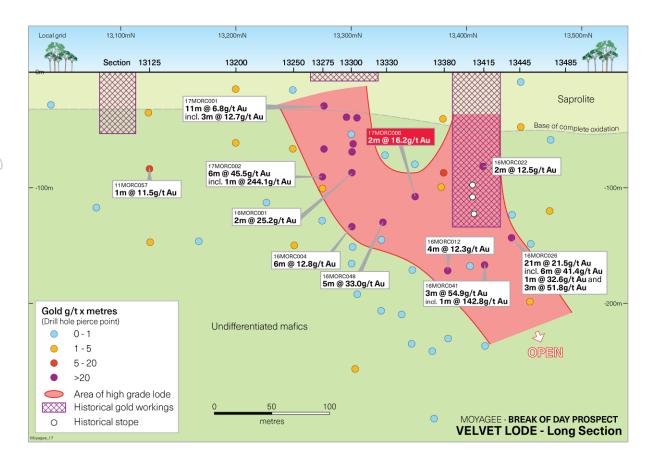

Figure 4: Break of Day long section of Velvet gold lode (a long section or longitudinal section is a section along the plane of the lode and in this instance shows gold grade x thickness variability with depth of the Velvet Lode)

THE CUE PROJECT

The Cue Project ("the Project") is a Farm-In and Joint Venture Agreement with Silver Lake Resources Limited ("Silver Lake") (ASX: SLR). Musgrave has met the Stage 1 Earn-In holding a 60% Joint Venture interest in the Project and has elected to progress to Stage 2 and increase its equity to 80%. The Project consists of the Moyagee Gold and Hollandaire Copper Resources (see ASX announcement 25 November 2015, "Musgrave Secures Advanced Gold and Copper Project") and surrounding tenure in the highly prospective Murchison province of Western Australia (Figure 5).

The Company believes there is significant potential to extend existing mineralisation and also discover new high grade mineralisation within the Project area, shown by the recent drilling success at Break of Day and Lena.

About Musgrave Minerals

Musgrave Minerals Limited is an active Australian gold and base metals explorer. The Cue Project in the Murchison region of Western Australia is an advanced gold and copper project. Musgrave's focus is to increase gold and copper resources through discovery and extensional drilling to underpin studies that will demonstrate a viable path to near term development. Musgrave also holds the highly prospective active epithermal Ag-Pb-Zn-Cu Corunna Project in the prospective silver and base metals province of the southern Gawler Craton and a large exploration footprint in the Musgrave Province in South Australia. Musgrave has a powerful shareholder base with three mining and exploration companies currently participating as cornerstone investors.

Competent Person's Statement Exploration Results

The information in this report that relates to Exploration Targets and Exploration Results is based on information compiled and/or thoroughly reviewed by Mr Robert Waugh, a Competent Person who is a Fellow of the Australasian Institute of Mining and Metallurgy (AusIMM) and a Member of the Australian Institute of Geoscientists (AIG). Mr Waugh is Managing Director and a full-time employee of Musgrave Minerals Ltd. Mr Waugh has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Waugh consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

Forward Looking Statements

This document may contain certain forward-looking statements. Forward-looking statements include, but are not limited to statements concerning Musgrave Minerals Limited's (Musgrave's) current expectations, estimates and projections about the industry in which Musgrave operates, and beliefs and assumptions regarding Musgrave's future performance. When used in this document, words such as "anticipate", "could", "plan", "estimate", "expects", "seeks", "intends", "may", "potential", "should", and similar expressions are forward-looking statements. Although Musgrave believes that its expectations reflected in these forward-looking statements are reasonable, such statements are subject to known and unknown risks, uncertainties and other factors, some of which are beyond the control of Musgrave and no assurance can be given that actual results will be consistent with these forward-looking statements.

Table 1(a): Summary of Drill Hole Locations and Significant Assay Intervals

Drill Hole ID	Drill Type	Prospect	Easting (m)	Northing (m)	Azimuth (degrees)	Dip (degrees)	RL (m)	Total Depth (m)	Sample Type	From (m)	Interval (m)	Au (g/t)	Lode
17MORC003	RC	Break of Day	581898	6936094	120	-60	417	225	Individual 1m	173	1	117.4	Twilight
17MORC006	RC	Break of Day	581967	6936110	120	-60	416	141	Individual 1m	120	2	16.2	Twilight

Notes to Table 1(a)

- 1. An accurate dip and strike and the controls on mineralisation are only interpreted and the true width of mineralisation is not yet confirmed although it is likely be 50-80% of the intersection width.
- 2. At Break of Day and Lena composite 6 metre samples outside the gold lode systems were collected with assay results still awaited. One metre individual samples within the vein lodes were submitted for priority analysis. All samples are analysed using a 50g fire assay with ICP-MS (inductively coupled plasma mass spectrometry) finish gold analysis (0.005ppm detection limit) by Genalysis-Intertek in Maddington, Western Australia.
- 3. g/t (grams per tonne), ppm (parts per million), ppb (parts per billion), X = below detection limit
- 4. NSI (No Significant intersection) No gold assay above 1g/t.
- 5. Velvet = Interpreted Velvet Gold Lode; Twilight = Interpreted Twilight Gold Lode

JORC TABLE 1 Section 1 Sampling Techniques and Data

Criteria	Explanation	Commentary
Sampling techniques	Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation,	Sampling is undertaken using standard industry practices including the use of duplicates and standards at regular intervals. All Reverse circulation (RC) samples are split to 1-3kg in weight through a cyclone splitter on the drill rig.
2	such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.	A Thermo Scientific Niton GoldD XL3+ 950 Analyser is available on site to aid geological interpretation. No XRF results are reported.
)))	Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.	All co-ordinates are in UTM grid (GDA94 Z50) and drill hole collars have been surveyed by differential GPS to an accuracy of 0.01m.
)	Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1m	RC samples were collected as 6m composites for all drill holes. One metre individual samples are immediately submitted for analysis where a high probability of mineralisation occurs (e.g. quartz vein lode or massive sulphide). All one metre samples are split to 1-3kg in weight through a cyclone splitter which is air blasted clean at the end of each 6m rod.
)	samples from which 3kg was pulverised to produce a 30g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent	Individual samples weigh less than 3kg to ensure total preparation at the laboratory pulverization stage. The sample size is deemed appropriate for the grain size of the material being sampled.
)	sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.	Samples are sent to the Genalysis – Intertek laboratory in Maddington. Samples are pulverized to 85% passing -75um and four metre composite samples are analysed using a 50g fire assay with ICP-MS (inductively coupled plasma - mass spectrometry) finish gold analysis (0.005ppm detection limit). Individual one metre gold samples are analysed using a 50g fire assay with ICP-MS finish for gold.
Drilling techniques	Drill type (e.g. core, reverse circulation, openhole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, facesampling bit or other type, whether core is oriented and if so, by what method, etc).	An RC drilling program was undertaken by Ausdrill with a 5 5/8 inch hammer. A total of 44 RC holes have to date been drilled in this program at Break of Day and Lena. Prior to this program a total of more than 40 RC holes and 7 diamond drill holes have been drilled by MGV at Break of Day to date. This is MGV's first drilling campaign specifically targeting the Lena deposit. Historically Silver Lake Resources Ltd (SLR) undertook RC drilling at Break of Day and Lena between 2010 and 2013 with a number of companies intermittently drilling prior to 2009. A combination of historical RAB, aircore, RC and diamond drilling has been utilised by multiple companies over a thirty year period across the broader project area.
Drill sample recovery	Measures taken to maximise sample recovery	RC bulk sample weights are observed and noted in a field Toughbook computer by MGV field staff. Drillers use industry appropriate methods to maximise sample recovery
	and ensure representative nature of the samples.	and minimise downhole contamination. A cyclone splitter was utilised to split 1-3kg of sample by weight. The splitter is air blasted clean at the end of each 6m rod.
)	Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.	No significant sample loss or bias has been noted.
Logging	Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.	All geological, structural and alteration related observations are stored in the database.
)	Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. The total length and percentage of the relevant	Logging of lithology, structure, alteration, mineralisation, colour and other features of core or RC chips is undertaken on a routine 1m basis. All drill holes are logged in full on completion.
Cub campling	intersections logged.	
Sub-sampling techniques and sample preparation	If core, whether cut or sawn and whether quarter, half or all core taken. If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or	No diamond drilling was undertaken during this program. RC samples are routinely cyclone split and kept dry by the use of pressurised air. No wet sampling occurred.
	dry. For all sample types, the nature, quality and appropriateness of the sample preparation technique.	Drill sample preparation and base metal and precious metal analysis is undertaken by a registered laboratory (Genalysis – Intertek). Sample preparation by dry pulverisation to 85% passing 75 micron.

		Quality control procedures adopted for all sub- sampling stages to maximise representivity of	Field QC procedures involve the use of certified reference standards (1:50), duplicates (~1:30) and blanks (1:50) at appropriate intervals for early stage
		samples. Measures taken to ensure that the sampling is	exploration programs. High, medium and low gold standards are used. Sampling is carried out using standard protocols and QAQC procedures as
		representative of the in situ material collected,	per industry practice.
		including for instance results for field	Duplicate samples are inserted (~1:30) and more frequently when in high
		duplicate/second-half sampling.	grade gold veins, and routinely checked against originals.
