

Ventnor Resources Limited (ASX: VRX) (**Ventnor** or the **Company**) provides the following summary of activities conducted during the September 2017 quarter.

Exploration

During the September quarter, the Company evaluated numerous exploration and mining prospects. During the June quarter, the Company had become aware of the burgeoning demand in the Asia/Pacific region for construction and silica sand. While the market had been investigated in previous years, the looming shortage of product for the market caused increasing prices, making Australian prospects more competitive - despite the additional distance and shipping costs. The Company investigated prospective sites which had had some prior exploration indicating suitable sand -- along with an important logistics solution - proximate to either a port or connecting rail. Certain areas along the under-utilised Eneabba-Geraldton rail line were more closely examined; EL applications were made for ground which was intersected by the rail line.

During the September quarter Ventnor applied for ELA70/5027 which land is contiguous to that of earlier applications made in the June quarter at Eneabba, WA. Ventnor has nominated these tenements collectively as its Arrowsmith Project. The combined area has some historic exploration, predominantly for heavy mineral sand, which indicated potential for significant sand resources. While generally Vacant Crown Land, Arrowsmith has very little Freehold land and has significant clearing from previous seismic programs for oil and gas exploration.

The Company acquired topographic data which better indicates the dune systems which were more closely investigated. During the quarter Ventnor conducted field trips to selected areas of the tenement, took surface and near surface samples and early stage mapping surveys, in an effort to understand the geology of the area.

Ventnor believes the Arrowsmith Project is highly prospective for high-quality silica and construction sand.

Further investigation revealed a global market demand for high quality sand, and specifically, an Asian/Pacific regional market demand for quantities of construction-quality sand. Contact has been established with the two largest importers of construction sand in to Singapore; samples have been forwarded for their test work. Further discussions will be undertaken following the test results next quarter.

Investigations in to the potential market were extensive, wide ranging and time consuming, resulting in a comprehensive collation of market data.

Events Subsequent to the Quarter

On 12 October 2017 Ventnor made an announcement to the market headed 'New Arrowsmith Silica Sand Project' which contained comprehensive details of the results of the enquiries conducted throughout the September quarter. The contents of that announcement follows:

Ventnor Resources Ltd (**Ventnor**) (ASX: VRX) announced a new silica sand project at Arrowsmith, 270km north of Perth, WA.

During the June and September quarters Ventnor applied for three Exploration Licenses totaling 350 km² holding significant sand prospects.

For personal use only

Arrowsmith Project Location

Arrowsmith could address dwindling sand supply in the Asia-Pacific region used in glass manufacturing, concrete construction and as a tech metal.

Supply deficits are due to Asian regional governments acknowledging sand as a strategic resource. Prior mining activities such as river dredging have caused environmental damage. Coastal developments are increasing, reducing access to resources, as is social pressure on often illegal sand mining operations.

Asian demand is increasing for energy-saving double glazing and for applications within the expanding automobile industry in China and India.

Demand is increasing for high purity silica sand in the production of Photo Voltaic panels and Silicon-Metal composite material for high capacity Lithium-ion rechargeable batteries.

Demand for sand in current burgeoning infrastructure-construction programs utilising concrete in Asia - particularly China, India and Vietnam - has put pressure on suppliers and consequently, on prices.

Preliminary reconnaissance work on the Arrowsmith Project indicates substantial potential for sand resources suitable for both glass making and construction.

Arrowsmith is traversed by the Eneabba-Geraldton rail line, which provides direct access to the ship-loading facilities at the Geraldton Port facilitating a unique logistics solution.

For personal use only

EL applications predominantly cover Vacant Crown Land, are extensively covered by cleared tracks from historic oil exploration seismic surveys, and easily accessed by the adjacent Brand Highway.

The area potentially has low environmental impact mining propositions; rehabilitation techniques are well established in the industry.

Preliminary assays and testwork indicate that processing to upgrade the silica to glass- making quality will have a low capital intensity, low technical risk and requiring no chemicals.

SILICA SAND

MARKET DYNAMICS

1. Globally, silica sand is a strong growth mineral due to the demand by the construction sector, wherein its use in the manufacture of flat glass for windows is constant. Greater growth is being felt in the Asian market, particularly China where there is a massive glass manufacturing expansion.
2. There's increased demand for specialised plate glass required in double glazing created by Asian/Pacific governments in efforts to reduce energy demands.
3. Developing Asian markets have increasing demand for glass in their developing automobile industry.
4. New markets address increasing demand for silica sand as a "tech metal" for use in production of Photo Voltaic panels and Silicon-Metal composite material for high capacity Lithium-ion rechargeable batteries.
5. Rationalisation of major producers of silica sand has resulted in a relatively small number of sand-producing corporations.
6. The market for silica sand in the Asia/Pacific region is forecast to advance 6.1% per year to 138 million metric tons in 2018.
7. Silica sand demand by region is shown in table below:

Region	% of Global demand
Asia-Pacific	47%
North America	20%
Western Europe	16%
Eastern Europe	8%
Africa/Middle East	5%
Central and South America	4%

SILICA SAND USES

Introduction

Quartz is the most common silica crystal and the second most common mineral on the earth's surface. It is found in almost every type of rock: igneous, metamorphic, and sedimentary. While quartz deposits are abundant, and quartz is present in some form in nearly all mining operations, high purity and commercially viable deposits occur less frequently. Silica sand deposits are most commonly surface-mined in open pit operations, but dredging and underground mining methods are also employed.

Silica sand has supported human progress throughout history, being a key raw material in the industrial development of the world, especially in the glass, metal casting, and ceramics industries. Silica contributes to today's information technology revolution, being used in computer components, providing raw materials for silicon chips and as quartz for PV panels.

Glassmaking

Silica sand is the primary component of all types of standard and specialty glass. It provides the essential SiO_2 component of glass formulation; its chemical purity is the primary determinant of colour, clarity and strength in glass. Industrial sand is used to produce flat glass for building and automotive use, container glass for foods and beverages, and tableware.

Metal Casting

Industrial sand is an essential part of both the ferrous and non-ferrous foundry industries. Metal parts ranging from engine blocks to sink faucets are cast in a sand-and-clay mould to produce their external shape, using a resin-bonded core to create the desired internal shape. Silica's high fusion point ($1,760^\circ\text{C}$) and low rate of thermal expansion produce stable cores and moulds compatible with all pouring temperatures.

Metallurgical Uses

In metal production, silica sand operates as a flux to lower the melting point and viscosity of slag to make it more reactive and efficient. Lump silica is used either alone or in conjunction with lime to achieve the desired base/acid ratio required for final purification of metals.

Chemical Production

Silicon-based chemicals are found in thousands of everyday applications ranging from food processing to soap and dye production. These chemicals are used in products such as household and industrial cleaners, in the manufacture of fibre optics, and to remove impurities from cooking oil and brewed beverages.

Paint and Coatings

Paint formulators select micron-sized industrial sands to improve the appearance and durability of architectural and industrial paints and coatings. High purity silica produces critical performance properties such as brightness reflectance and colour consistency.

Ceramics

Ground silica is an essential component of the glaze and body formulations of all types of ceramic products, including tableware, sanitary ware and floor and wall tile. In the ceramic body, silica is the skeletal structure onto which clays and flux components attach. Silica products are also used as the primary aggregate to provide high-temperature resistance to acidic attack in industrial furnaces.

Filtration and Water Production

Industrial sand is used to filter water to become drinkable. Uniform grain shapes and grain size distributions produce efficient filtration bed operations for the removal of contaminants from wastewater to provide potable water. As silica is chemically inert, it will not degrade or react when it comes in contact with acids, contaminants, volatile organics, or solvents.

Oil and Gas Recovery

Known commonly as proppant, or "frac sand," industrial sand is pumped down holes in deep well applications to prop open rock fissures to increase the flow rate of natural gas or oil. In this specialised application, round whole-grain sand is used to maximise permeability and to prevent formation cuttings from entering the well bore.

For personal use only

CONSTRUCTION SAND

Construction sand is the primary structural component in a wide variety of building and construction products. Whole-grain silica is used in flooring compounds, mortars, specialty cements, stucco, roofing shingles, skid-resistant surfaces, and asphalt mixtures to provide packing density and flexural strength without adversely affecting the chemical properties of the binding system. Ground silica performs as a functional extender to add durability, anti-corrosion and weathering properties in epoxy-based compounds, sealants and caulks.

ASIAN MARKETS

SINGAPORE

Singapore building construction uses one million tonnes of concrete a month, which includes 300,000 tonnes of construction sand. Current sources are Malaysia, Cambodia, Myanmar and occasionally Philippines. Other regional sources have placed restrictions on or have totally banned exports of their local sand. Sources are generally dredged from rivers with consequential unacceptable environmental impacts. The Singapore Building and Construction Authority (BCA) has placed a requirement that 5% of construction sand be imported from “non-traditional” sources which includes Australia. Singapore is concerned that current sources may become unreliable or intermittent and is actively encouraging a greater spread of sources. Importers are concerned that the BCA will raise that requirement to 10% from non-traditional sources, as originally intended. If Singapore continues at its current rate of growth, this could be a significant market for Australian suppliers.

INDIA

The building expansion program underway has put incredible pressure on sand suppliers for concrete, so much so that illegal dredging of rivers has resulted in recent public scrutiny of the environmental long-term impacts. This is also potentially a significant market for construction sand.

VIETNAM

Vietnam has gone from an exporter of industrial sand, to an importer, with increased use in concrete with a significant building boom underway.

Ventnor management believes that the Arrowsmith Project has the potential for significant silica sand resources to supply increasing markets in the Asia-Pacific region for both glass making and construction and increasingly the Tech metal market.

Arrowsmith Project Details

Ventnor Resources has applied for three exploration licenses north of Eneabba, Western Australia, to explore for construction sand and high-quality silica sand. The details of these tenements, known collectively as the Arrowsmith Project, are shown below in Table 1.

Tenement	Holders	Application Date	Expected Grant Date	Area (Km ²)
ELA70/4986	Ventnor Mining Pty Ltd	25/05/2017	Early Q1 2018	93
ELA70/4987	Ventnor Mining Pty Ltd	25/05/2017	Early Q1 2018	86
ELA70/5027	Ventnor Mining Pty Ltd	29/08/2017	Late Q1 2018	179

Table 1 – Arrowsmith Tenement Details

The targeted silica sand deposits are the aeolian sand dunes that overlie the Pleistocene limestones and paleo-coastline which host the Eneabba heavy mineral deposits.

The Exploration Targets for the Arrowsmith Project are:

Arrowsmith North – 100 Million to 140 Million tonnes high-quality silica sand;

Arrowsmith South – 40 Million to 80 Million tonnes high-quality silica sand.

The potential quality and grade of these Exploration Targets are conceptual in nature. There has been insufficient exploration to estimate a Mineral Resource; it is uncertain if further exploration will result in the estimation of a Mineral Resource.

The image (Figure 1) below is a topographic map of the area generated by Shuttle Radar Topography Mission data (**SRTM**). This map was used to identify potential dune structures as topographic highs, which have been followed by ground field investigation and sampling using a hand-held auger.

The image (Figure 2) below is a schematic section showing the silica sand dune that is targeted for exploration. The targeted dune is the area above the surrounding natural surface and well above the standing water table.

Figure 2 Schematic section of Silica Sand Dune Exploration Target

Three areas were investigated: Arrowsmith North for construction sand which may also be upgraded to glass quality; Arrowsmith Central, which is prospective for sand and also limestone; and Arrowsmith South, prospective for high quality silica sand.

Initial samples were taken by hand auger and selected from below the humus layer, typically the first 30cm. Samples were sent to Intertek Laboratory in Perth for silica sand analysis via a Four-Acid digest and ICP finish. The table below shows the major constituents of the sand, with full analytical results available in the Appendix.

High grade silica sand is sand which has purity greater than 99.5% SiO₂. It typically will require processing to remove the various deleterious minerals to achieve the highest possible silica grade. Auger samples were composited into two samples representing “Cream” and “Yellow” sand and supplied to Nagrom Laboratory in Perth to determine the Size by Analysis.

This technique analyses the elemental chemistry of a suite of particle sizes to determine where the deleterious minerals report to. Below is a selected summary of the results; the full table is contained within the appendix.

The results indicate that +90% of the dune sand is sized between +0.212mm and -1mm, preferentially retains the silica sand grains while eliminating many of the impurities.

These preliminary indications are encouraging in that the dune sand located on the Arrowsmith tenements can be upgraded by conventional techniques, to provide a high-grade purity of 99.5% SiO₂ with only nominal amounts of benign deleterious minerals.

EXPLORATION TARGETS

Exploration Targets for potential high-grade silica sand have been generated for two areas within the Arrowsmith Project: Arrowsmith North and Arrowsmith South, see below:

Arrowsmith North

Arrowsmith North Exploration Target

The Arrowsmith North Exploration Target area focuses on a prominent broad dune structure, (see above), and avoids existing infrastructure and potential conservation areas. The potential volume is estimated from the 40mRL (surrounding RL) to the top of the dune and assumes that between 70% and 100% of the dune is silica sand suitable for processing. The estimate uses an *in-situ* bulk density of 1.5t/m³ to calculate the tonnage. The area has the potential to be a significant tonnage of construction sand adjacent to the Eneabba-Geraldton rail line with direct access to the Geraldton Port. The target grade of +95% SiO₂ is considered conservative as all samples, except two, taken from the area exceed this value; processing is expected to increase this grade.

For personal use only

Arrowsmith South

The Arrowsmith South Exploration Target focuses on the southern end of a topographical high that is noted as containing an intercalation of limestone and dune sands (see below), and avoids existing infrastructure and potential conservation areas. The potential volume is estimated from the 45mRL to the top of the dune and assumes that between 50% and 100% of the dune is silica sand for processing. The estimate uses an *in-situ* bulk density of 1.5t/m³ to calculate the tonnage. The target grade of +95% SiO₂ is considered conservative as assays from all samples taken from the area exceed this value; processing is expected to increase this grade.

Arrowsmith South Exploration Target

The initial metallurgical testwork indicates that the *in-situ* sand can be beneficiated to produce a high SiO₂ silica sand product, suitable for commercial sale.

For personal use only

Future Work

Mineralogical analysis is currently underway to determine the deleterious minerals that remain in the +0.212mm and -1mm size fraction. Dependent on this determination, testwork will determine the best methodology to remove these minerals from the silica sand grains.

A deeper hand-auger program will be undertaken in the next few months to better determine the variability of the sand quality through the dune system.

An aircore drilling program is proposed to determine the extent of the dune system and the variability of the grade, to be undertaken early 2018 when granting of the tenements is anticipated.

Bulk samples will be collected to undertake further metallurgical testwork and determine the most suitable processing circuit.

Competent Person's Statement

The information in this release that relates to Exploration Results is based on, and fairly represents, information compiled by Mr David Reid who is a Member of the Australian Institute of Geoscientists (MAIG). Mr Reid is a contractor to Ventnor Resources Limited. Mr Reid has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the "2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves". Mr Reid consents to the inclusion in this report of the matters based on information provided by him and in the form and context in which it appears.
