

DEVELOPING INTO ONE OF THE BEST HIGH-GRADE GOLD EXPLORATION PROJECTS IN WEST AFRICA

HIGHLIGHTS

- Continued high-grade gold strikes at Golden Hill
- Initial drilling at fifth drilling prospect – C-Zone:
 - 11 m @ 4.87 g/t Au from 52m downhole depth (DHD) incl. 2 m @ 11.32 g/t Au (GHDD-189)
 - 6 m @ 4.64 g/t Au from 52m DHD including 2 m @ 10.77 g/t Au (GHDD-188)
 - 8 m @ 3.76 g/t Au from 61m DHD including 1 m @ 19.74 g/t Au (GHDD-191)
- Continuing drilling at Ma Prospect (Ma Main, Ma East, Ma North):
 - 7 m @ 5.78 g/t Au from 14m DHD and 6 m @ 2.35 g/t Au (GHDD-095)
 - 13 m @ 2.35 g/t Au from 102m DHD including 4 m @ 4.83 g/t Au (GHDD-139)
 - 11 m @ 2.13 g/t Au from 20m DHD (GHDD-120)
- Continuing drilling at Peksou Prospect:
 - 17 m @ 2.17 g/t Au from 86m DHD including 5 m @ 4.05 g/t Au (GHDD-207)
 - 4 m @ 7.21 g/t Au from 78m DHD including 1 m @ 27.41 g/t Au (GHDD-209)
 - 28 m @ 1.28 g/t Au from 54m DHD including 4 m @ 2.32 g/t Au (GHDD-211)
- Visible gold and favorable drill results continuing at Jackhammer Hill
- An extensive drill campaign is underway, with C\$8M budgeted for 2018 and currently two diamond core drills working on-site over all 5 prospects
 - additional drills are planned for periodic drilling evaluation throughout the year
 - metallurgical test work has started
- Joint Venture expects to issue an initial resource by the end of 2018

Boss Resources Limited (ASX: BOE) (“Boss” or the “Company”) is pleased to report that Teranga Gold Corporation (“Teranga”) (TSX: TGZ) announced on 1 February 2018 (Canadian time) that advanced drilling continues to yield new discoveries and high-grade, near surface and deeper gold mineralization at the Ma prospect on the Golden Hill property in Burkina Faso, West Africa (Figure 1). Teranga has an earn-in agreement on the Golden Hill property with Boss Resources.

Richard Young, President and CEO of TGZ, states “Golden Hill, located in the heart of the proven gold producing Houndé Greenstone Belt, is developing into one of the best high-grade gold exploration projects in West Africa.”

The full Teranga announcement is enclosed.

Boss currently holds a 49% interest in joint venture with Teranga over the Golden Hill and Gourma Gold Projects located in Burkina Faso, West Africa. Teranga manages the joint venture and is funding all exploration on the projects up to the completion of a definitive feasibility study (“DFS”) and Decision to Mine.

On delivery of the DFS, Teranga’s interest in the joint venture will increase to 70% and they retain the rights to acquire an additional 10% in the joint venture for A\$2.5 million. Upon completion of the DFS but prior to a Decision to Mine, Boss may elect to convert the remainder of their interest to a 1.5% Net Smelter Return, otherwise Boss shall be free carried to a decision to mine and will then be required to contribute on a pro rata basis.

Boss Managing Director, Mr Duncan Craib, states “Following the previous sensational drill results reported on the Golden Hill prospects (see ASX: BOE 17 November and 20 November 2017), Teranga’s latest drilling results further confirms our project is located in one of the most prospective gold belts in the world which hosts a number of high-grade gold discoveries, including the Siou, Yaramoko and Houndé deposits.

“Boss is a direct beneficiary of Teranga’s project spend which continues to add incremental value to the projects. In just one year, Golden Hill has produced a series of high-grade, near-surface drill results at the first four prospects: Ma, Nahiri, Peksou, and Jackhammer Hill (where bonanza gold grades were intercepted). It is very encouraging to see the latest positive results from initial drilling in the new 5th prospect, C-Zone, continuing to build on this success.

“Due to the free carried nature of the joint venture agreement prior to the completion of a DFS and Decision to Mine, Boss directly benefits from the expanded exploration program planned for 2018 in the order of C\$8M. The solid results combined with a renewed interest in the West African gold sector has resulted in the Boss being approached regarding the potential divestment of its interest in the joint venture. To assist in assessing this interest, Boss has appointed corporate advisors in relation to assessing options to maximise the inherent value of the joint venture interest and Boss will provide further updates as appropriate.

“Boss’s Board of Directors genuinely regards the Golden Hill Project as a significantly attractive exploration and development opportunity, and they remain focused on maximising shareholder value.”

David Mallo, Teranga’s Vice President, Exploration, follows “Golden Hill continues to demonstrate excellent correlation of the various mineralized zones at each of the five prospects drilled to-date. Based on these positive results, we have budgeted \$8 million for this year’s exploration program at Golden Hill to move the five current prospects into an initial resource by year end and to expand our exploration program outwards to initiate exploration of more than a half dozen other targets. The combined positive drill results at Ma,

Peksou, Jackhammer Hill, Nahiri, and now C-Zone are encouraging. We have five advanced high-grade exploration prospects all within a 5-kilometre radius from a central point, which increases our confidence that Golden Hill represents Teranga’s next mine in Burkina Faso.”

Golden Hill Exploration Activities

Teranga has been regularly releasing results of its recent drilling at the Golden Hill Gold property. The announcements confirm early-stage drilling continues to yield high-grade, near-surface oxide gold mineralization at its Golden Hill property in Burkina Faso, West Africa.

The Golden Hill property is comprised of three adjacent exploration permits covering 470km² located in southwest Burkina Faso in the central part of the Houndé Greenstone Belt. This belt hosts a number of high-grade gold discoveries, including the Siou, Yaramoko and Houndé deposits, the latter property being contiguous with Golden Hill. To the south of Golden Hill is another large land position where active exploration programs are well underway.

Each of the five prospects successfully drilled to date are located approximately 5 kilometres from a central point (Figure 1). An all-prospect table of complete drill results is available on TGZ’s website, <http://www.terangagold.com> (exploration section).

Earn-in Agreement

The salient terms of the earn-in agreement with Teranga and Boss on the Golden Hill and Gourma Gold Projects are as follows:

- Teranga and Boss currently own 51% and 49% respective interest in the Golden Hill and Gourma Gold Projects;
- Teranga to sole manage the joint venture and fund all exploration on the projects up to the completion of a DFS and Decision to Mine;
- Boss has a free carried interest to completion of a DFS and decision to mine;
- On delivery of the DFS Teranga's interest in the joint venture will increase to 70%;
- Teranga has the right to acquire an additional 10% in the joint venture for A\$2.5 million cash;
- Upon completion of the DFS but prior to a Decision to Mine, Boss may elect to convert the remainder of their 20% interest to a 1.5% Net Smelter Return, otherwise Boss shall be free carried to a decision to mine and will then be required to contribute on a pro rata basis; and
- Pre-emptive rights stipulated should a third-party offer exist.

Competent Persons Statements

Teranga's exploration programs are being managed by Peter Mann, FAusIMM. Mr. Mann is a full-time employee of Teranga and is not "independent" within the meaning of National Instrument 43-101. Mr. Mann has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves" (the "JORC Code"). Mr. Mann is a "Qualified Person" under National Instrument 43-101 Standards of Disclosure for Mineral Projects. The technical information contained in this news release relating exploration results are based on, and fairly represents, information compiled by Mr. Mann. Mr. Mann has verified and approved the data disclosed in this release, including the sampling, analytical and test data underlying the information. The RC and diamond core samples are assayed at the BIGGS Laboratory in Ouagadougou, Burkina Faso. Mr. Mann has consented to the inclusion in this news release of the matters based on his compiled information in the form and context in which it appears herein. See Appendix 2 for the JORC Code explanations relating to the results in this press release.

Drilling Results Tables

APPENDIX 1

Recent Golden Hill drill results continue to demonstrate excellent correlation of the various mineralized zones at the five prospects drilled to-date. A complete list of C-Zone, Ma, Peksou, Jackhammer Hill and Nahiri highlight drill results reported in this news release is included in the following Table 1.

Table 1: C-Zone, Ma, Peksou, Jackhammer Hill and Nahiri Prospects – Selected Drill Highlights

APPENDIX 2

JORC Code, 2012 Edition – Table 1 Report

Section 1: Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections)

Criteria	2012 JORC Code explanation	Commentary
Sampling techniques	<ul style="list-style-type: none"> • Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling. • Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. • Aspects of the determination of mineralisation that are Material to the Public Report. • In cases where ‘industry standard’ work has been done this would be relatively simple (e.g. ‘reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay’). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information. 	<ul style="list-style-type: none"> • Diamond Core holes are being reported in this news release. These drill holes are part of an ongoing drilling program at the Golden Hill Property where a number of Prospects are being evaluated. Sampling is of half NQ2 core from the DD drilling. • Drill core was sawn in half over 1-metre defined sampling intervals, then one-half sampled and assayed for gold. Oriented core markings were used as guides for sawing. Occasionally quarter core was submitted for check assays. • Diamond core was sampled selectively based on visual identification of mineralisation. Further sampling will occur should initial results warrant extending the sampling intervals.

For personal use only

For personal use only

Criteria	2012 JORC Code explanation	Commentary
Drilling techniques	<ul style="list-style-type: none"> • Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc.). 	<ul style="list-style-type: none"> • Diamond drill holes were drilled using standard HQ or NQ sized rods.
Drill sample recovery	<ul style="list-style-type: none"> • Method of recording and assessing core and chip sample recoveries and results assessed. • Measures taken to maximise sample recovery and ensure representative nature of the samples. • Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. 	<ul style="list-style-type: none"> • Diamond core recoveries were measured and recorded for each sample. Core was sampled on standard 1 m core lengths based on metre-to-metre drill measurement markings. • Drill contractors have been requested to maximize recoveries throughout each drill hole and there has not been a significant issue with core recovery in both oxide and fresh rock. • There is no evidence to suggest a relationship between sample recovery and grade as there is no significant loss of material. Sample recoveries are of good quality.
Logging	<ul style="list-style-type: none"> • Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. • Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc.) photography. • The total length and percentage of the relevant intersections logged. 	<ul style="list-style-type: none"> • Core samples were geologically and geotechnically logged following established standard operating procedures and includes sufficient and appropriate detail to support Mineral Resource estimation, mining and metallurgical studies. • Logging is qualitative in nature. All core was photographed. • All recovered core was logged, but not all drilled core was sampled.

For personal use only

Criteria	2012 JORC Code explanation	Commentary
Sub-sampling techniques and sample preparation	<ul style="list-style-type: none"> • If core, whether cut or sawn and whether quarter, half or all core taken. • If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry. • For all sample types, the nature, quality and appropriateness of the sample preparation technique. • Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. • Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling. • Whether sample sizes are appropriate to the grain size of the material being sampled. 	<ul style="list-style-type: none"> • Drill core sampling intervals were defined then cut in half with a diamond saw along the core length following orientation lines. Half core was sampled over one-metre lengths. • The primary sample is pulverized in entirety at BIGGs Laboratory in Ouagadougou by LM2 and split to a 200g sub sample using riffle splitting. A 50g subsample from this pulp is then selected for analysis. Sampling and subsampling methods are industry standard and are appropriate for the type of drilling. The use of the riffle tiered splitter is a demonstrated method of accurately splitting the primary sample and the field method has been validated with the field duplicate data over the 8 years of exploration activity in Burkina Faso. • Field duplicate data is routinely reviewed and show acceptable precision and variability. • Field duplicate data indicates acceptable variability indicating coarse gold is not a significant issue in the sampling.

For personal use only

Criteria	2012 JORC Code explanation	Commentary
Quality of assay data and laboratory tests	<ul style="list-style-type: none"> The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc... Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established. 	<ul style="list-style-type: none"> Gold assays for Core drilling were obtained by using a 50g charge for a lead collection fire assay with an AAS finish. This is considered to be total gold estimate. Assaying was conducted in Ouagadougou by BIGGS Laboratories. Not applicable Certified reference materials, blanks and duplicates are regularly inserted into the sample preparation and analysis process with approximately 10% of all samples being related to quality control. Data is reviewed before being accepted into the database. Any batches failing QAQC analysis resubmitted for check assays. Dataset QAQC contains acceptable levels of precision and accuracy.
Verification of sampling and assaying	<ul style="list-style-type: none"> The verification of significant intersections by either independent or alternative company personnel. The use of twinned holes. Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. Discuss any adjustment to assay data. 	<ul style="list-style-type: none"> Significant intersections have been reviewed by staff geologists to check the geological context. All sample and recovery data is recorded to paper forms at the time of drilling. Data is then keypunched into controlled excel templates with validation. Geological logging is directly logged into template log sheets by Toughbook computer. The templates are then provided to an internal database manager for loading in Datashed database management software. Referential integrity is checked as part of the data loading process into Datashed.

Criteria	2012 JORC Code explanation	Commentary
Location of data points	<ul style="list-style-type: none"> • Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. • Specification of the grid system used. • Quality and adequacy of topographic control. 	<ul style="list-style-type: none"> • Drill hole collar locations were surveyed by trained site based technicians using real time differential GPS (DGPS) to a sub decimetre accuracy in horizontal and vertical position. Signal correction completed using the Omnistar network. Vertical precision was supplemented using a Digital Surface Model created from WorldView-2 stereo imagery incorporating DGPS ground control points. Down hole drill hole surveys were undertaken by the drill contractor utilizing a Reflex EZ-Shot downhole survey instrument and by single shot Eastman Cameras. Survey intervals of 30m and end of hole were routinely collected. No strongly magnetic units are present within the deposit which may upset magnetic based readings. • Topographic control is based on World View 2 stereoscopic processed image, providing additional <1m RL precision.
Data spacing and distribution	<ul style="list-style-type: none"> • Data spacing for reporting of Exploration Results. • Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. • Whether sample compositing has been applied. 	<ul style="list-style-type: none"> • Drilling was spaced at distances nominally divisible by 20m, typically on 40m centres. • Drilling is of an initial investigative nature and not sufficient to define mineral resources at this time. • No sample compositing has been utilized.

For personal use only

For personal use only

Criteria	2012 JORC Code explanation	Commentary
Orientation of data in relation to geological structure	<ul style="list-style-type: none"> Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material. 	<ul style="list-style-type: none"> Drill hole azimuths and dips have been oriented as much as possible perpendicular to the interpreted mineralised zones in order to intersect the true widths of the zones as closely as possible. Occasionally, drilling was planned at oblique angles when the mineralisation trends were not yet well defined or if the optimal collar location was not accessible. Generally, the majority of drilling is oriented such that the sampling of mineralisation is unbiased. While at an early stage drilling orientation is not considered to introduce significant bias.
Sample security	<ul style="list-style-type: none"> The measures taken to ensure sample security. 	<ul style="list-style-type: none"> Core samples are removed from the field immediately upon drilling and stored in a secure compound for sub sampling and preparation for lab dispatch. Samples are collected directly from site by the laboratory. Sample submission forms are sent in paper form with the samples as well as electronically to the laboratory. Reconciliation of samples occurs prior to commencement of sample preparation of dispatches
Audits or reviews	<ul style="list-style-type: none"> The results of any audits or reviews of sampling techniques and data. 	<ul style="list-style-type: none"> All QA/QC data is reviewed in an ongoing basis and reported in monthly summaries. All QAQC data up until December 2012 has been reviewed and documented by CSA Global of Perth. Data subsequent to this period has been reviewed by the CP for this release.

Teranga Gold Strikes More High-Grade Gold at Golden Hill

Initial drilling at fifth drilling prospect – C-Zone – intersects 11 m @ 4.87 g/t Au

Toronto, Ontario – February 1, 2018 – Teranga Gold Corporation ("Teranga" or the "Company") (TSX: TGZ, OTCQX: TGCDF) is pleased to announce that early-stage drilling continues to yield high-grade, near-surface and deeper gold mineralization at its Golden Hill property in Burkina Faso, West Africa. Teranga has an earn-in agreement on Golden Hill with Boss Resources Limited (ASX:BOE) pursuant to which Teranga, as operator, can earn a minimum 80% interest in the joint venture upon delivery of a feasibility study and payment of AU\$2.5 million.

"Golden Hill, located in the heart of the proven gold producing Houndé Greenstone Belt, is developing into one of the best high-grade gold exploration projects in West Africa," said Richard Young, President and Chief Executive Officer. "With positive results from initial drilling at C-Zone and ongoing drill success at Ma, Peksou, Jackhammer Hill and Nahiri, we are expanding our 2018 drill program and initiating the supporting technical work for this rapidly advancing project."

An extensive 2018 drill campaign is underway on all five prospects and the Company expects to issue an initial resource by the end of 2018.

"Golden Hill continues to demonstrate excellent correlation of the various mineralized zones at each of the five prospects drilled to-date. Based on these positive results, we have budgeted \$8 million for this year's exploration program at Golden Hill to move the five current prospects into an initial resource by year end and to expand our exploration program outwards to initiate exploration of more than a half dozen other targets," stated David Mallo, Vice President, Exploration. "The combined positive drill results at Ma, Peksou, Jackhammer Hill, Nahiri, and now C-Zone are encouraging. We have five advanced high-grade exploration prospects all within a 5-kilometre radius from a central point, which increases our confidence that Golden Hill represents Teranga's next mine in Burkina Faso."

The following highlight results are from the Company's most recent drilling program, completed in late 2017.

C-Zone Prospect

- 11 m @ 4.87 g/t Au including 2 m @ 11.32 g/t Au (GHDD-189)
- 6 m @ 4.64 g/t Au including 2 m @ 10.77 g/t Au (GHDD-188)
- 8 m @ 3.76 g/t Au including 1 m @ 19.74 g/t Au (GHDD-191)

The C-Zone prospect is located just south of the Peksou prospect (Figure 1 in Appendix 1) and has a current strike length of approximately 500 metres. Historical drilling at C-Zone was to shallow depths below which the Company targeted down-dip extensions of previously intersected mineralization.

Ma Prospect (Ma Main, Ma East, Ma North)

- 7 m @ 5.78 g/t Au and 6 m @ 2.35 g/t Au (GHDD-095)
- 13 m @ 2.35 g/t Au including 4 m @ 4.83 g/t Au (GHDD-139)
- 11 m @ 2.13 g/t Au (GHDD-120)
- 16 m @ 1.62 g/t Au including 4 m @ 2.98 g/t Au (GHDD-085)

For personal use only

The step-out drill program at the Ma structural complex comprising Ma Main, Ma East and Ma North continues to provide excellent hole-to-hole correlation along trend and to depth. The Ma plan map (Figure 2 in Appendix 1) of drilling completed to-date indicates a combined drilled strike extent for Ma Main and Ma East of 2.4 kilometres and a separate partially drilled strike extent for Ma North of 1.2 kilometres. Representative drill sections for Ma are included in Figures 3, 4 and 5 in Appendix 1.

Peksou Prospect

- 17 m @ 2.17 g/t Au including 5 m @ 4.05 g/t Au (GHDD-207)
- 28 m @ 1.28 g/t Au including 4 m @ 2.32 g/t Au (GHDD-211)
- 4 m @ 7.21 g/t Au including 1 m @ 27.41 g/t Au (GHDD-209)

Follow-up drilling of an initial successful five-hole drill program at the Peksou prospect intersected very positive drill intersections on 40 and 80-metre sections across an approximate 600-metre strike extent. The structurally controlled mineralization at Peksou occurs in both mafic volcanic, dioritic and granodioritic host units, similar to Ma and Jackhammer Hill.

Jackhammer Hill Prospect

- 5 m @ 4.32 g/t Au (GHDD-144)
- 4 m @ 1.92 g/t Au and 6 m @ 1.23 g/t Au (GHDD-146)
- 5 m @ 1.62 g/t Au including 1 m @ 6.01 g/t Au (GHDD-143)

A 10-hole step-out drill program was completed at Jackhammer Hill to follow-up favorable drill results. To-date, approximately 1,000 metres of strike extent has been drill tested predominantly on 40 and 80-metre sections. Field observations from three recent drill holes at Jackhammer Hill report visible gold. These results are pending and will be reported in a subsequent news release.

Nahiri and Nahiri West Prospects

- 8 m @ 1.63 g/t Au including 1 m @ 5.36 g/t Au (GHDD-176)
- 11 m @ 1.33 g/t Au including 1 m @ 4.90 g/t Au (GHDD-178)

A short drill program at the Nahiri and Nahiri West prospects met with modest success. Of note was the anomalous intersection observed in drill hole GHDD-178, which averages 0.48 g/t Au over its lower 123 metres. This intersection confirms similar very wide intervals of anomalous mineralization in earlier reverse circulations drill holes, necessitating a re-interpretation that will focus on possible crossing structures that may be controlling these wide anomalous intervals.

Other Activities & Next Steps

As part of the 2018 drill campaign, two diamond core drills are working on-site. Additional drills are planned for periodic drilling evaluation throughout the year.

In addition to ongoing drilling at the five advanced prospects, the Company plans initial field evaluations at other undrilled Golden Hill prospects including A-Zone, B-Zone, Didro, Intie, Nabere and Nabale. Geologic modeling and initial resource estimation for the most advanced prospects is planned for year-end 2018. Composite samples for preliminary metallurgical test work programmes are in progress and base line environmental studies are planned for later this year.

Drilling Results Table

Recent Golden Hill drill results continue to demonstrate excellent correlation of the various mineralized zones at the five prospects drilled to-date. A complete list of C-Zone, Ma, Peksou, Jackhammer Hill and Nahiri highlight drill results reported in this news release is included in the following Table 1.

Table 1: C-Zone, Ma, Peksou, Jackhammer Hill and Nahiri Prospects – Selected Drill Highlights

Competent Persons Statements

Teranga's exploration programs in Burkina Faso are being managed by Peter Mann, FAusIMM. Mr. Mann is a full time employee of Teranga and is not "independent" within the meaning of National Instrument 43-101 – Standards of Disclosure for Mineral Projects ("NI 43-101"). Mr. Mann has sufficient experience which is relevant to the style of mineralization and type of deposit under consideration and to the activity which he is undertaking to qualify as a "Qualified Person" under NI 43-101. The technical information contained in this news release relating to exploration results are based on, and fairly represents, information compiled by Mr. Mann. Mr. Mann has verified and approved the data disclosed in this release, including the sampling, analytical and test data underlying the information. The RC and diamond core samples are assayed at the BIGGS Laboratory in Ouagadougou, Burkina Faso. Mr. Mann has consented to the inclusion in this news release of the matters based on his compiled information in the form and context in which it appears herein.

Forward-Looking Statements

This press release contains certain statements that constitute forward-looking information within the meaning of applicable securities laws ("forward-looking statements"), which reflects management's expectations regarding Teranga's future growth and business prospects (including the timing and development of new deposits and the success of exploration activities) and opportunities. Wherever possible, words such as "intent", "belief", "believe", "expects", "estimates", "plans", "planned", "anticipated", "ability", "developing", "leading towards", "can attain" and similar expressions or statements that certain actions, events or results "should", "may" or "will" have been used to identify such forward-looking information.

Specific forward-looking statements in this press release include next steps and targeting an initial resource by year end. Although the forward-looking statements contained in this press release reflect management's current beliefs based upon information currently available to management and based upon what management believes to be reasonable assumptions, Teranga cannot be certain that actual results will be consistent with such forward-looking statements. Such forward-looking statements are based upon assumptions, opinions and analysis made by management in light of its experience, current conditions and

its expectations of future developments that management believe to be reasonable and relevant but that may prove to be incorrect. These assumptions include, among other things, the ability to obtain any requisite governmental approvals, including renewals of the Golden Hill exploration permits in 2018, the accuracy of sampling, analytical and test data underlying the exploration results included herein, gold price, exchange rates, fuel and energy costs, future economic conditions, and anticipated future estimates of free cash flow. Teranga cautions you not to place undue reliance upon any such forward-looking statements.

The risks and uncertainties that may affect forward-looking statements include, among others: the inherent risks involved in exploration and development of mineral properties, including government approvals and permitting, changes in economic conditions, changes in the worldwide price of gold and other key inputs, changes in mine plans and other factors, such as project execution delays, many of which are beyond the control of Teranga, as well as other risks and uncertainties which are more fully described in Teranga's Annual Information Form dated March 30, 2017, and in other filings of Teranga with securities and regulatory authorities which are available at www.sedar.com. Teranga does not undertake any obligation to update forward-looking statements should assumptions related to these plans, estimates, projections, beliefs and opinions change. Nothing in this document should be construed as either an offer to sell or a solicitation to buy or sell Teranga securities. All references to Teranga include its subsidiaries unless the context requires otherwise.

About Golden Hill

The Golden Hill property is comprised of three adjacent exploration permits covering 470 km² located in southwest Burkina Faso in the central part of the Houndé Greenstone Belt. This belt hosts a number of high-grade gold discoveries, including the Siou, Yaramoko and Houndé deposits. The latter property is contiguous with Golden Hill. To the south of Golden Hill is another large land position where active exploration programs are well underway.

Each of the five prospects successfully drilled to date are located approximately 5 kilometres from a central point (Figure 1 in Appendix 1). An all-prospect table of complete drill results is available on the Company's website, <http://www.terangagold.com> (exploration section).

About Teranga

Teranga is a multi-jurisdictional West African gold company focused on production and development as well as the exploration of more than 5,000 km² of land located on prospective gold belts. Since its initial public offering in 2010, Teranga has produced more than 1.2 million ounces of gold from its operations in Senegal, which as of June 30, 2017 had a reserve base of 2.7 million ounces of gold. Focused on diversification and growth, the Company is advancing its Wahgnion Gold Project, with our recently released positive feasibility study, and conducting extensive exploration programs in three countries: Burkina Faso, Senegal and Côte d'Ivoire. Teranga has a strong balance sheet and the financial flexibility to execute on its growth strategy. The Company has nearly 4.0 million ounces of gold reserves from its combined Sabodala Gold operations and Wahgnion Gold Project.

Steadfast in its commitment to set the benchmark for responsible mining, Teranga operates in accordance with the highest international standards and aims to act as a catalyst for sustainable economic, environmental, and community development as it strives to create value for all of its stakeholders. Teranga is a member of the United Nations Global Compact and a leading member of the multi-stakeholder group responsible for the submission of the first Senegalese Extractive Industries Transparency Initiative revenue report. The Company's responsibility report is available at www.terangagold.com/responsibilityreport and is prepared in accordance with its commitments under the United Nations Global Compact and in alignment with the Global Reporting Initiative guidelines.
