

ALKANE RESOURCES LTD (ALK)

A Tech Miner for the Future

Alkane Resources Ltd (ALK) is a future miner of specialty metals, currently progressing final permitting and bankable feasibility studies on the Dubbo Zirconia Project (DZP) in NSW.

The DZP is considered a world-class asset of strategic value, containing a large polymetallic resource of zirconium, hafnium, niobium and rare earths which can support a long mine-life (+20 years). The metal mix is considered especially important for high-tech and advanced materials manufacturing.

The project is located only 25km from Dubbo, Central West NSW in a region with very good infrastructure (roads, rail, power, gas and potential workforce). The project financials appear robust and highlight potential for significant cash flows (+A\$300mpa EBITDA), but the A\$1.3b capital cost for construction is not without its substantial funding challenges (key risk) in this current market.

The Company's financing strategy targets a combination of Export Credit Agency (ECA) finance and bank debt, with discussions well advanced. Potential offtake partners for some of the specialty metals are also well progressed and could attract a strategic cornerstone investor (at the project level through the holding company Australian Zirconia Ltd). Alkane is targeting first production in 2018.

Gold producer with a pipeline of exploration opportunities

The Company has a gold production asset, Tomingley Gold Operations (TGO) which is generating solid cash flows. We forecast average production of ~65Kozpa at AISC of A\$1,230/oz over a LOM of ~7 years. We assume the current open pit operation transitions to a blended underground/open pit operation from late CY17.

The gold production underpins the current trading range, with generated cash funding the pre-construction activities at the DZP. Alkane is currently trading on a spot gold FY16 EV/EBITDA of 3.2x. Our TGO NPV₈ is ~A\$96m, implies 23cps value on an undiluted basis (current ordinary shares). Our 8cps assigned value includes new equity for the DZP project development, which is seen as the key value driver.

Initiate coverage with a Speculative Buy recommendation

We initiate coverage of Alkane Resources with a Speculative Buy recommendation and 12-month price target of 45cps. Our valuation (NAV) and price target assumes the DZP can be funded through development into production. Important near-term milestones such as marketing and offtake agreements, and potential strategic cornerstone investment(s) at the project level are seen as potential precursors to the final funding solution.

Strategic supply of criterial metals

The DZP has the potential to become a strategic supply (non-Chinese source) of specialty metals, providing stable long-term production and cost competitive pricing to expanding zirconium (advanced ceramics) and hafnium (super alloys for the aerospace industries), and rare earth (permanent magnets) markets. The products of the DZP are considered critical on global standards, due to their economic importance and potential for supply risk.

ALK is highly leverage to improved commodity prices and market sentiment. Permitting and funding are seen as the key risks to the DZP development.

Brief Business Description:

Multi-commodity mining and exploration company

Hartleys Brief Investment Conclusion

Currently focused on gold production (TGO), and development of a large zirconium, niobium and rare earths project (DZP). Objective to become a large specialty metals business.

Alkane listed on the

ASX in 1969

All current projects are located in the

Central West of NSW

The Company mined

gold at Peak Hill from

COMPANY OVERVIEW

Alkane Resources Limited ("Alkane", "Company") is a multi-commodity company focused on projects located in the Central West region of NSW.

The Company listed on the ASX ("ALK") in 1969 and has over the years produced gold from the Peak Hill gold mine (1996 to 2005) and the Tomingley Gold Operations (2014 to current), producing in excess of 260Koz of gold. The Tomingley Gold Operations (TGO) remains in production and has a targeted mine life of ~10 years. We forecast average production of ~65Kozpa at AISC of A\$1,230/oz over a LOM of ~7 years. The gold asset underpins the current trading range, with generated cash providing some funds for the ALK's project development pipeline.

The Company flagship project is the Dubbo Zirconia Project (DZP), which is considered world-class and contains a specialty metals including zirconium hafnium, niobium, and rare earths. The metal mix is considered especially significant for high-tech and advanced materials manufacturing end-users. Feasibility studies into the development of the project highlight potential for significant cash flows (+A\$300m EBITDA per annum), but the A\$1.3b capital cost for construction is not without its significant funding challenges in this current market. Financing is in progress and once in production will make Alkane a strategic and significant world producer of zirconium, hafnium and rare earth products and is targeting first production in 2018.

Near-term catalysts include completion of final permitting (grant of mining lease and environmental protection licence), project equity and offtake discussion and release of a BFS. The Company's cash position is estimated to be ~A\$21m.

Background

Fig. 2:

The Dubbo Zirconia Project (DZP) is located 25km south of Dubbo, some 400km northwest of Sydney, NSW. The project area is well located in the Central West Region of NSW which boasts substantial infrastructure (roads, rail, power, gas, light engineering, and potential workforce).

Source: Alkane Resources Limited

The DZP contains a very large polymetallic resource of the specialty metals including zirconium hafnium, niobium, and rare earths. The metal mix is considered of especially significant for high-tech and advanced materials manufacturing end-users.

The region boasts very good infrastructure with roads, rail, power, gas, light engineering, and potential workforce

Existing infrastructure will be utilised and upgraded as required

Proposed water pipeline some 8kms from the Macquarie River, connection to grid power and gas pipeline into rail corridor The DZP reserve highlights potential for a +35 year mine life, whereas resource highlight potential for +50 years (at an assumed 1Mtpa scaled operation)

FEED study released in August 2015, with Outotec appointed to provide the fixed price EPC

Definition: a trachyte

is a fine-grained alkaline igneous rock dominated by feldspar and small amounts of mafic mineral, usually pyroxene, however, hornblende and biotite also occur. Commonly associated with ocean island and continental rift magmatism.

Source: Imperial College London

Simple open pit mining with a very low strip ratio of ~0.2:1 (W:O) The current DZP reserves could support a very long mine life in the order of 35 years (assuming a 1Mtpa scale operation). The larger resource base also provides some confidence that the initial mine life of over 20 years from a single open pit, as considered in the feasibility studies (DFS) is very conservative. The currently defined resource could support an operation with a mine life in excess of 50 years, and as such could provide opportunites to lift production, if and when the specialty metals market can accommodate additional supply.

The Company has been refining and optimising the process flow sheet with a pilot plant in operation since 2008. The pilot plant operation has been providing products to test and evaluate markets and the Company has a JV partnership with Treibacher Industrie AG to produce and market ferro-niobium and is currently finalising a zirconium product marketing agreement for global sales distribution.

In August 2015, Alkane completed the front end engineering design (FEED) study which re-confirmed the robust technical and financial economics of the DFS (released April 2013). Federal environmental approvals were also received in August, which followed state approvals in May. Outotec (a Finnish engineering firm) were appointed for early contractor involvement in September 2015 to provide a fixed price EPC.

Large and outcropping volcanic intrusive; Simple mine plan

The largely homogeneous Toongi deposit (containing zirconium, niobium, tantalum and rare earths) is hosted by a trachyte^[D] lava or subvolcanic intrusive, part of an extensive alkaline volcanic complex (Jurassic aged ~190 million years old) within the Dubbo region. The oval-shape deposit (~900m x ~600m) is exposed at surface and covers a surface area of over 40ha, with a depth extent of over 150m (in parts).

The ore mineralogy is generally very fine grained (most < 20μ m), and all minerals are soluble in sulphuric acid with only minor refractory zircon and niobium reported. The orebody is also only weakly radioactive (low levels of uranium and thorium). The Toongi resource has been estimated from a drill spacing of 100m x 50m on a grid pattern, largely to a depth of ~55m with some holes to over 100m depth (confirming ore grades at depth). Approximately 49% (35.7Mt) of the total 73.2Mt resource is classified as Measured, which provides for a high level of confidence in the estimated ore reserves (35.9Mt).

Source: Alkane Resources Limited

The DZP development is based on a simple open cut mine plan which is quarry-like. The open cut covers an area of ~30ha and a depth of ~35 metres below current ground surface. Due to the size of the deposit, only 3.46Mt of waste (very low strip ratio (W:O) of ~0.2) will be removed during the initial 20 year mine life (Base Case). Mining is expected to be drill and blast, and hauled to a nearby ROM pad. The resource is capable of supporting open pit mining well in excess of 50 years.

Over the last 12months significant improvements and optimisation to the flow-sheet have been made through the collaboration with ANSTO, TZ Minerals International and Hatch

Fine-tuning the flowsheet, added a Hafnium circuit

Alkane over many years has developed a processing flow sheet to extract the high value metals from the ore. A pilot plant has been in operation at the Australian Nuclear Science and Technology Organisation (ANSTO) at Lucas Heights since 2008. Recent processing improvements include the addition of a hafnium circuit to refine a hafnium concentrate and further onsite separation of rare earths.

The flowsheet is a proprietary process developed by the Company, based on crushing and grinding, sulphuric acid roast, water leach, solvent extraction recovery and refining to produce high purity zirconium products. Niobium concentrate is recovered from the waste stream of the zirconia extraction, refined using acid leaching and converted to ferro-niobium. The process naturally separates the REEs into a dominant light rare earth element suite (LREE) and an yttrium-heavy rare earth element rich suite (HREE) which are recovered as concentrates from two streams. The LREE are washed out of the primary leach residue and reconcentrated by chemical precipitation. The HREE are recovered after the niobium extraction from the main process stream, prior to final neutralisation and residue disposal.

Source: Alkane Resources Limited

The inclusion of the hafnium circuit in the DZP has added significant value to the project The addition of the hafnium refining process has little impact on the existing flow sheet, but adds signifiant value, as the hafnium is extracted from the zirconium circuit. Further refinement of the hafnium process is planned for the DecQ with small samples to be analysed and further evaluated.

Recent work has improved the rare earth recoveries by an overall 11.5% and encouragingly the Alkane testwork has seen a 26.7% increase for dysprosium (Dy) recoveries and 7% for neodymium (Nd) recoveries, which are both expected to improve project revenues.

While the flow sheet naturally separates "light" rare earths (La, Ce, Pr, Nd and Sm) from the "heavy" rare earths (Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu and Y) the revised processing plan combines these two streams for initial on-site separation to produce a La-Ce concentrate for storage (or future processing), yttria (Y2O3) for direct sale and a Pr-Lu (95% REO) chemical concentrate for third party toll treatment. This process will facilitate maximum economic benefit, while minimising technical risk.

Awaiting grant of ML and receipt of the EPL

DZP grant of ML and EPL imminent

Alkane received the State development consent for the DZP in late May 2015, followed by Federal environmental approvals in August 2015, marking significant milestones for the project. Outstanding permits include grant of the mining lease (ML) and environmental protection licence (EPL); approvals are expected imminently.

ECI appointed for EPC and funding strategy unchanged

The FEED study (August 2015), re-confirmed robust technical attributes and strong financials for the DZP. The project is capable of generating annual revenues of A\$580m with operating costs of A\$260m, which equates to impressive A\$320mpa EBITDA, based on conservative prices (largely spot prices in July).

The Company's pre-tax NPV (8% discount rate) is A\$1.22b for a 17.5% IRR, over initial mine life of 20 years. The capital estimate for the project remains high at A\$1.3b, which includes a A\$103m contingency. Clearly funding for the project development remains a key risk, but the Company's financing strategy remains unchanged targeting a combination of strategic investors, Export Credit Agency (ECA) finance and bank debt.

Alkane appointed Outotec (Finnish processing technology supplier) in September 2015, to undertake an early contractor involvement (ECI) process for final design, identify further cost reductions and to produce EPC (fixed price) construction costs. The work is expected to lower the capital costs and aid compilation of the financing package.

The DZP product output is best summarised in Fig. 6, with tonnages based on recoveries from the demonstration (ANSTO) pilot plant.

Source: Alkane Resources Limited

The Company is working with an engineering contractor to deliver a fixed cost EPC contract and prepare a BFS for project financing

Product pricing

The DZP has the ability to provide long-term sustainable supply (non-Chinese) of a diverse range of specialty metals which remains a key drawcard for potential end users. The product diversity and markets could also offer revenue stability. Having operating costs denominated in AUD are also seen as a current advantage, particularly off the expectation that USD should strengthen over time.

Capex:	~A\$20m for UG (Hartleys Est)

Current mine life of ~7 years but targeting mine life extensions for +10 years

Source: Alkane Resources Limited, Hartleys Estimates

Background

Fig. 8:

The Tomingley Gold Project (TGO) is located ~50km south-west of Dubbo, some 450km north-west of Sydney, NSW. The gold mine is 100% ALK owned.

Alkane completed a DFS into the project development in late 2010. Approvals for construction took a considerable time, with the mining lease approval finally received in early 2013. The capital costs for the construction of the gold mine was ~A\$115m (slightly under budget), funded without the use of debt through shareholder proceeds and sale of a shareholding in Regis Resources (RRL). First gold was poured in February 2014.

The TGO is currently operating at a rate of 65-70Kozpa at AISC of \sim A\$1,250/oz. Operating cash flow is being re-invested back in to the gold operations and used to fund the pre-construction activities of the DZP.

TGO is currently operating at 65-70Kozpa at AISC of ~A\$1,250/oz.

Geology

Lode-style gold mineralisation

Significant exploration upside as the deposits remain open at depth

4 open pits, with

underground mines to

come on-line

The TGO covers Ordo-Silurian volcanics and sedimentary rocks with minor intrusives. Significant gold mineralisation throughout project area includes the Wyoming, Caloma gold deposits, the Peak Hill gold mine and the historic Myalls United gold mine.

The eastern Lachlan Orogen in southeastern Australia contains major porphyryepithermal-skarn copper-gold deposits of late Ordovician age. While many small quartz vein hosted or orogenic lode-type gold deposits are known in the region, the discovery of the Wyoming, Caloma gold deposits demonstrate the potential for larger lode-type mineralisation hosted within the same Ordovician volcanic stratigraphy.

Total gold resources for the TGO are 11.3Mt @ 1.9g/t Au for 687Koz Au (open pit and underground resources) and include ore reserves of 4.4Mt @ 1.6g/t Au for 235Koz (open pit) and 0.52Mt @ 3.7g/t Au for 61.6Koz (underground).

Open pits transitioning to blended underground/pits

The TGO is based on four gold deposits (Wyoming One, Wyoming Three, Caloma and Caloma Two) located about 14km north of the Alkane's original Peak Hill gold mine (closed in 2005). The Caloma Two resource has been incorporated into the open pit development schedule, and options for commencing underground operations on all resources (starting with Caloma Two and Wyoming One) are being evaluated (PFS work underway).

The TGO CIL plant has throughput capacity of 1Mtpa and comprises a standard two stage crushing, and grinding circuit with gravity/CIL gold recovery. Production levels remain a function of mined grades and througput as gold recoveries are good at +90% (averaging 93%). Recent production performance is summarised below.

Source: Alkane Resources Limited

We model the current open pit operation transitioning to include underground operations, which is based largely on the most recent mine schedule which provides indicative timing for both open pit and underground sequencing (see Fig 12).

Source: Alkane Resources Limited

Our modelling includes a capital requirement of A\$20m for the initial underground development, which we expect will be staged and funded through current cash and forecast cash-flows. Our production forecasts are largely in-line of recent Company guidance (though subject to change).

Production forecasts are subject to change

Underground mine expected to use longhole open stoping and Avoca-type stoping

UG is likely to be owner-operator at this stage Source: Alkane Resources Limited; Hartleys Estimates

Source: Alkane Resources Limited

RESERVES AND RESOURCES

Alkane reported updated ore reserves and mineral resources for the TGO as at 30th June 2015, which take into account mine depletion. Maiden underground reserves for Wyoming One and Caloma Two were released 10th December 2015. Potential exists to upgrade the resource categories.

Fig. 14: TGO Reserves – 30 June 2015 (OP) and 10 December 2015 (UG)

DZP reserve supports a 35 year mine life

DZP resource conversion could provide over 50 year

mine life (at the current assumed project scale 1Mtpa) The DZP FEED study provided no material changes to the DZP ore reserves and mineral resources, as announced late August 2015.

Fig. 16:	DZP Reserves – 27 August 2015

KEY SUPPLIERS & CUSTOMERS

Key contractors and offtake agreement well advanced In Sep

ALK engaged engineering consultants Hatch to complete the capital estimate to bring the DZP into production. The Front End Engineering Design (FEED) study, completed to an accuracy of +/- 15% provided capex of -A\$1.3b (includes a contingency).

In September 2015, the Company appointed Outotec (processing technology supplier) to undertake an early contractor involvement (ECI) process to further refine the final process design, identify further cost reductions and to produce EPC (fixed price) construction costs.

Now finalising offtake agreements

JV with Treibacher to produce and market Fe-Nb Alkane works collaboratively with fleet hire equipment provider, Emeco to improve overall mining productivity at the TGO, with work to date providing a 12% increase in payloads and 10% increase in operating efficiencies.

The Company is finalising a zirconium product marketing agreement for global product distribution, and remains well advanced on discussions for further offsite rare earth processing to separate product marketing. Alkane has a JV with Treibacher Industrie AG to produce and market the Ferro-Niobium production from the project.

GEOGRAPHIC EXPOSURE

ALK is currently focused on operations within NSW, Australia.

Zr chemicals have numerous applications

including high-tech

coatings on jet

engines and 3D

printing ink

Current world demand

for zirconium

chemicals and zirconia ~160Ktpa

MARKETS – HIGH-TECH SPECIALTY METALS

Zirconium (Zr)

Zirconium is a transitional metal largely derived from the mineral zircon. Zirconium is a hard, grey-white metal with very good corrosion resistance characteristics and as such has a wide range of applications.

Zircon supply by the mineral sands industry is largely controlled by two major producers (Rio Tinto and Iluka Resources) with an estimated 90% of the market supply. End user demand for zircon is estimated to be ~1Mtpa (2015), with the market currently in surplus with producer inventories considered high. The market is expected to stabilise in the next couple of years with a forecast compound annual growth rate (CAGR) of ~5% pa thereafter. The leading producers anticipate the zircon market should move into deficit in 2018, which times well for ALK.

End user demand for zircon is mostly for ceramic use (~50% of the market), with production from the DZP targeting the chemicals application which constituents ~21% of the market. Zirconium materials are classified into three broad categories: fused zirconia, zirconium chemicals and chemical zirconia. China dominates the downstream zirconium industry with an estimated 85-90% control.

Source: Alkane Resources Ltd

Hafnium (Hf)

Hf has applications in super alloys for the aerospace industry

At the DZP, the source of hafnium is a hydrous zirconium silicate mineral containing hafnium oxide as opposed to zircon Hafnium is associated with zirconium, and are nearly identical chemically. Hafnium is a lustrous grey metal that has unique high-temperature properties making it amenable for superalloy application (particularly in the aerospace industry). It is usually traded as hafnium metal in 'crystal bar' form, or as hafnium oxide (HfO₂) or hafnium tetrachloride (HfCl₄). At the DZP, the source of hafnium is a hydrous zirconium silicate mineral containing hafnium oxide as opposed to zircon.

Fig. 20: Hf Supply (LHS); Hf Demand (RHS)

75% of hafnium metal is produced in France Demand for hafnium is outstripping production, and the USA as a by-product of zirconium metal with an increasing volume used in highmanufacture.

Source: Alkane Resources Ltd Page 14 of 27

The demand for a sustainable long-term supply of hafnium is highly sought after

Nb is frequently alloyed with steel because of its strength at high temperatures and lightweight characteristics

Alkane's successful production of a hafnium concentrate is seen as a significant milestone for the project, and appears well timed as demand for hafnium metal continues to outstrip supply. Marketing efforts to maximize the value of these products produced has already commenced and potentially high-value offtake arrangements could follow. The demand for a sustainable long-term supply of hafnium is highly sought after. Alkane comment that Spot hafnium metal prices have almost doubled in the last 3 years to US\$1,500/kg, while long term prices have also increased to ~US\$600-800/kg.

Niobium (Nb)

The DZP is forecast to produce ferro-niobium. Niobium is a metal with superconductive properties used mostly in alloys and superalloys. The largest application of ferro-niobium is the production of high-strength low alloy (HSLA) steels. Niobium supply is dominated by Brazil, with CBMM accounting for 85% of global supply. The Niobium market is worth ~U\$S3-4b, with current pricing reflecting general weak steel demand. Recent prices for ferro-niobium were in the range of US\$35-40/kg (niobium content) across markets.

Rare Earths (REO)

The rare earths industry remains small but is still high value (estimated worth over US\$3-5b annually). The separation of individual rare earths requires specialised recovery techniques, and as such it remains a boutique market which is often limited. The market remains fragile and due to its size can at times be over-supplied.

Rare earths (praseodymium, neodymium, dysprosium and mixed praseodymiumneodymium oxide) used in permanent magnet dominant current demand and has forecast growth. Whereas some of the light rare earths (cerium and lanthanum) remain over-supplied with low demand.

Directors (as summarised from Alkane website)

John Dunlop, Non-Executive Chairman

Mr Dunlop is a consultant mining engineer with over 45 years surface and underground mining experience in both Australia and overseas. He is a former director of the Australasian Institute of Mining and Metallurgy (2001 - 2006) and is currently the chairman of MICA (Mineral Industry Consultants Association). Mr Dunlop is non-executive chairman of Alliance Resources Limited (appointed 30 November 1994). Recently, he has also been a non-executive director of Copper Strike Limited (9 November 2009 – 6 June 2014) and a director of Gippsland Limited (1 July 2005 - 12 July 2012). Mr Dunlop is also a certified arbitrator and mineral asset valuer and consults widely overseas. Appointed director and Chairman 3 July 2006.

David (Ian) Chalmers, Managing Director

Mr Chalmers is a geologist and graduate of the Western Australia Institute of Technology (Curtin University) and has a Master of Science degree from the University of Leicester in the United Kingdom. He has worked in the mining and exploration industry for over 40 years, during which time he has had experience in all facets of exploration and mining through feasibility and development to the production phase. Mr Chalmers was Technical Director until his appointment as Managing Director in 2006, overseeing the group's minerals exploration efforts across New South Wales, Western Australia, Indonesia and New Zealand and the development and operations of the Peak Hill Gold Mine (NSW). Since taking on the role as chief executive he has steered the Company through construction and development of the now fully operational Tomingley Gold Operations and to the threshold of development of the world class Dubbo Zirconia Project. Appointed director 10 June 1986, appointed Managing Director 5 October 2006

Ian Gandel, Non-Executive Director

Mr Gandel is a successful Melbourne based businessman with extensive experience in retail management and retail property. He has been a director of the Gandel Retail Trust and has had an involvement in the construction and leasing of Gandel shopping centres. He has previously been involved in the Priceline retail chain and the CEO chain of serviced offices. Through his private investment vehicles, Mr Gandel has been an investor in the mining industry since 1994. Mr Gandel is currently a substantial holder in a number of publicly listed Australian companies and, through his private investment vehicles, now holds and explores tenements in his own right in Victoria, Western Australia and New South Wales. Mr Gandel is also a non-executive director of Alliance Resources Ltd (appointed 15 October 2003), and non-executive chairman of Octagonal Resources Limited (appointed 10 November 2010). Appointed director 24 July 2006.

The Alkane Board of Directors are experience mining executives

High level of technical expertise

Ian Gandel is Alkane's largest shareholder with ~22% of the ordinary shares

Anthony Lethlean, Non-Executive Director

Australian and internationallyexperienced Board Mr Lethlean is a geologist with over 10 years' mining experience, including 4 years underground on the Golden Mile in Kalgoorlie. In later years, he has worked as a resources analyst with various stockbrokers and investment banks including CIBC World Markets. He was a founding director of Helmsec Global Capital Limited which seeded, listed and funded a number of companies in a range of commodities. He retired from the group in 2014. He is also a non-executive director of Alliance Resources Ltd (appointed 15 October 2003). Appointed director 30 May 2002.

Karen Brown (Company Secretary)

Ms Brown is an honours graduate in economics from the University of Western Australia and is a director of Mineral Administration Services Pty Ltd which provides company secretarial, accounting, treasury and financial administration services to a number of listed public companies primarily in the resources sector.

MAJOR SHAREHOLDERS

MAJOR SHAREHOLDERS

Alkane has two substantial shareholders:

- Abbotsleigh Pty Ltd (Ian Gandel) with 91.6m shares or ~22.1% •
- FIL Limited with 41.3m shares or ~10.0% •
- Alkane Board holds ~23% of the ordinary shares on issue.

OPTIONS, CONVERTIBLES AND UNPAID CAPITAL No options.

The Company has performance rights as part of short-term and long-term incentive programs for ALK employees. Alkane also has share appreciation rights. The total number of performance and share appreciation rights is ~32.6m. The performance and share appreciation rights that do not vest will lapse unless otherwise determined by the ALK Board.

ALK has two substantial shareholders

FINANCIALS

PRODUCTION FORECASTS

Company guidance TGO and DZP

Our modelling for the TGO is based largely on the most recent mine schedule which provides indicative timing for both open pit and underground sequencing and anticipated production ounces (see below).

Funding remains the

biggest hurdle to

project development

(project engineering is at construction stage

awaiting finance).

Our modelling for the DZP has been based on the DFS (released 2013) and refined by the project enhancements reported in the front end engineering design (FEED) study (released August 2015). Our modelling assumes that the project is fundable, potentially through part divestment of some project interest (strategic investment for long term supply of some specialty metals), Export Credit Agency (ECA) funding (long life project, international interest), bank debt and new equity (cornerstone investor(s), potential component for offtakes). Alkane's current indicative timeline is summarised below. All these timelines are subject to change and considered indicative only.

Debt

Alkane is currently debt free. We model a funding requirement of ~A\$1.3b as per the FEED study update. We assume a Debt to Equity (D:E) ratio of ~60:40, which could imply a future debt position of ~\$800m, which is in-line of Company's indicative advice for Export Credit Agency (ECA) and Commercial Bank Debt (CBD) capacity of 60-70%.

Hedging

ALK currently has no debt and some gold forwards in place ALK currently has 22,500oz at an average forward price of A\$1,596/oz hedged (as at the end of September 2015).

Dividends

We expect the Company to focus on development and exploration and hence dividends are unlikely for some considerable time.

SENSITIVITIES

FX exposure

ALK is exposed to FX changes affecting AUD commodity prices.

Interest Rate exposure

The Company currently has no exposure to interest rates.

Commodity price exposure

ALK is exposed to gold, zirconium, hafnium, niobium, yttrium and other rare earths commodity prices. Some of the specialty metals are dominated by Chinese supply and can be subject to contract pricing.

Fig. 31: Commodity F	Price A	Assump	otions u	ised in	our mo	odelling	1

PRELIMINARY BASE CASE VALUATION

combination of ECA finance and bank debt.

We model an initial 20 year mine-life at the DZP The gold operation (TGO) generates free cash which is in turn reinvested into the flagship DZP which is seen as the current key value driver for the Company.

Our sum of parts valuation for ALK assumes a ~7 year mine-life (LOM) at TGO with average production of ~65Kozpa at AISC of ~A\$1,230/oz. We assume the current open pit operation transitions to a blended underground/open pit operation from late CY17. Our TGO valuation is A\$96m, implies 23cps value (around current trading levels), on an undiluted basis (current ordinary shares). Our 8cps assigned value includes new equity for the DZP project development (diluted for new equity).

Our valuation (NPV) for the DZP uses a discount rate of 12% and assumes the project

can be successfully funded (seen as a major risk to our valuation). The Company is

well advanced in regards to potential offtake partners for some of the specialty metals and due to the project's long mine life (+20 years) and anticipated cash generation could attract a strategic cornerstone investor (either at the project level or Company level). At this stage we assume 100% project interest, with debt funding from a

DZP modelling assumptions are summarised on Fig 27

We assume a nominal A\$40m (4cps) for exploration upside potential

Our modelling dilutes for new equity

Hartleys NAV for ALK is A\$0.49/share

The shallow Toongi deposit is capable of supporting open pit mining well in excess of 50 years (reserve mine life is ~35 year). We assume a nominal \$A40m (\$0.04/share) value for exploration upside potential.

INVESTMENT THESIS & RECOMMENDATION

We initiate coverage of Alkane Resources with a Speculative Buy recommendation and with a 12-month price target of 45cps.

The Company has a gold production asset (TGO) which is generating solid cash flows. We forecast average production of ~65Kozpa at AISC of A\$1,230/oz over a LOM of ~7 years. The gold asset underpins the current trading range, with generated cash funding the pre-construction activities at the world-class zirconia project (DZP). The development of the DZP is seen as the key value driver.

The DZP is currently progressing final permitting (ML and EPL) and bankable feasibility studies. The project financials appear robust (even at the current depressed commodity prices) but not without its significant funding challenges in this current market. Our valuation and price target assumes the DZP can be funded through development into production. Important near-term milestones such as marketing and offtake agreements for the specialty metals, and potential strategic cornerstone investment(s) at the project level are seen as potential precursors to the final funding solution. Government assisted ECA-style funding and bank debt are expected to provide a vast majority of the funds needed for the A\$1.3b total project capex.

The DZP has the potential to become a strategic supply (non-Chinese source) of specialty metals, providing stable long-term production and cost competitive pricing to expanding zirconium (advanced ceramics) and hafnium (super alloys for the aerospace industries), and rare earth (permanent magnets) markets.

SIMPLE S.W.O.T. TABLE

	Strengths	- Gold production generating cash (being re-invested)
Gold production		 World-class specialty metals project (DZP)
generating cash		- Low cost operation
gonorating out		- Strong board and management team – highly experienced
		- Solid cash position
Exploration Unside		- Growing markets for target commodities
		- State and Federal environmental approvals in place
		- Early contractor involvement for the EPC
		- Proven process flowsheet – pilot plant testing since 2008
	Weaknesses	- Significant funding requirement for the DZP development
Significant funding		- Chinese supply dominance
requirement		- Final permitting required (EPL and ML)
		- Lack of offtake agreements
	Opportunities	 New markets and technology advances
		- Introduction of a strategic partner
		- Exploration upside
nrico woaknoss		- M&A activity
price weakness	Threats	- Exploration downside
		- Commodity prices and market sentiment
		- Potential takeover
		- FX

RISKS

Key risks for ALK include final permitting for the DZP (Environmental Protection Licence (EPL) and Mining Lease (ML) approvals), completion of Early Contractor Involvement (ECI) for the fixed price EPC and financing of the project development.

Fig. 36: Key assui	mptions and risks	for valuation	
Assumption	Risk of not realising assumption	Risk to valuation if assumption is incorrect	Comment
DZP is fully permitted with EPL and ML granted	Low	High	Environmental approvals have been received at State and Federal levels. The EPL and ML approvals are expected soon.
DZP is financed through development into production	Medium	High	The DZP has a very high capital requirement (~A\$1.3b). We model conventional debt & equity funding (60:40 D:E), we believe our assumptions are achievable though there are significant risks associated with funding in the current environment
Long mine life at the DZP	Moderate	Meaningful	ALK is leveraged to the success of the development and production at DZP. We model a 20 year mine-life, though the reserve mine life is +35 years. If the operations vary largely from our modelling our valuation will be at risk to the downside
Model parameters	Moderate	Meaningful	We have made a number of large assumptions in our valuation of ALK, changes in these assumptions can change our valuation to both the upside and downside
Orebody Risk	Low to Medium	Meaningful	As with all orebodies there is risk around geology, geotech and metallurgy although with a processing design fined-tuned through a pilot plant some of these risks are somewhat negated
Commodity prices	Moderate	High	ALK is reliant on strong commodity prices although both TGO and DZP appear economic at current spot prices
Conclusion	We have r	nade significant assumpti	ions but believe these are achievable.

Hartleys Recommendation Categories

Buy	Share price appreciation anticipated.
Accumulate	Share price appreciation anticipated but the risk/reward is
	not as attractive as a "Buy". Alternatively, for the share
	price to rise it may be contingent on the outcome of an
	uncertain or distant event. Analyst will often indicate a
	price level at which it may become a "Buy".
Neutral	Take no action. Upside & downside risk/reward is evenly
	balanced.
Reduce /	It is anticipated to be unlikely that there will be gains over
Take profits	the investment time horizon but there is a possibility of
	some price weakness over that period.
Sell	Significant price depreciation anticipated.
No Rating	No recommendation.
Speculative	Share price could be volatile. While it is anticipated that,
Buy	on a risk/reward basis, an investment is attractive, there
	is at least one identifiable risk that has a meaningful
	possibility of occurring, which, if it did occur, could lead to
	significant share price reduction. Consequently, the
	investment is considered high risk.
