Dear Madam,

Whicher Range-5 Well, 31 October 2003

Main Points

Current depth 1768 metres. 24 hour progress was 96 metres.

Operations Summary for 24 Hours to 06:00 Hours 31 October 2003

Drilled to a current depth of 1768 metres, without incident. Pulled out of hole to change bit.

Operation for next 24 hours

Drilling ahead with new bit.

Geological Summary

Lithology primarily sandstone with minor gas shows.

Background

The Whicher Range field was discovered by Union Oil Development Corporation in 1968 and drilled near the centre of a large domal structure approximately 12 kilometres by 6 kilometres in size. The top of the reservoir sequence is at a depth of approximately 3700 metres. A 450 metres interval of gas bearing Permian sandstones was intersected in Whicher Range-1. Three additional wells have been drilled on the Whicher Range field and all recovered gas at low rates from many tested intervals. Two wells, Whicher Range-1 and 4, are presently capable of producing at about one million cubic feet per day (1.1 terajoules/day) and three million cubic feet per day (3.2 terajoules/day), respectively. The gas is clean and of high quality. Much has been learned from the existing wells about drilling, completion and reservoir stimulation practices. Water is particularly damaging to the reservoirs.

In 1999, Amity successfully increased gas flow in the Whicher Range-4 well, from about one million cubic feet per day (1.1 terajoules/day) to about 3 million cubic feet per day (3.2 terajoules/day), with a pilot liquid carbon dioxide frac (fracture stimulation operation). This was the first frac to increase gas flow. All 12 previous fracs used water and as a result, decreased gas flow due to reservoir damage.

The field has estimated gas in place of 4 trillion cubic feet (more than 4,000 Petajoules).
Well Location

The Whitcher Range Gas Field is located onshore, approximately 200 kilometres south of the city of Perth, Western Australia and 22 kilometres south of the city of Busselton. The well will be located at Latitude 33 deg 50’ 54.35”S and Longitude 115 deg 21’ 36.83”E in Petroleum Exploration Permit EP 408. The ground elevation is 124.8 metres above mean sea level.

The favourable location of the field, about 35 kilometres south-west of the southern end of the main gas pipeline from the North-West Shelf, means it can compete on price and transport tariff with gas from the North-West Shelf. A gas supply from Whitcher Range would be strategically advantageous for Perth and the South-West, by reducing dependence on the long single pipeline from the North-West Shelf.

Objective

The objective of Whitcher Range-5 is to appraise the flow potential of the gas bearing Sue group in the same general area as Whitcher Range-1 and 4. There is virtually no exploration risk at this location of not intersecting the gas bearing zone. A great deal of effort will be expended to protect the formation from reservoir damage. By drilling the main objective with only air there will be no water based formation damage, which is one of the main reasons for the poor results in previous wells. Gas will be allowed to flow out of the reservoir continuously while drilling and be burnt in a specially designed flare pit. If a commercial rate is achieved in the top part of the Sue group the drilling will be terminated and the commercial flow potential evaluated.

Drilling Program

The drilling programme is designed so that the Sue Group objective section can be drilled with air, while the overlying formations are behind casing. Drilling to the top of the Sue Group will be by conventional over-balanced, water based drilling fluids, which proved effective and virtually trouble free during the drilling of Whitcher Range-4. The gas reservoirs will be drilled under-balanced with air to avoid reservoir damage and to attempt to obtain commercial gas flow rates (greater than 6 million cubic feet per day) without reservoir stimulation. If reservoir stimulation is required, a full scale liquid carbon dioxide frac will be applied.
