

## ASX ANNOUNCEMENT

# Sulphide Mineralisation Intersected in Fraser Range Gabbro

- Diamond Drilling has intersected disseminated sulphides dominated by pyrrhotite and chalcopyrite (copper sulphide) within a Fraser Range Complex gabbro sequence.
- Core has been logged and is being transported to ALS for cutting, assaying and petrology.
- Rumble's 4 drill holes only tested a small section within the 2km bedrock conductor highlighting the potential to host mineralised massive sulphides zones.
- A downhole EM program is to commence imminently.

Rumble Resources Ltd ("Rumble" or "the Company") is pleased to provide an update on its maiden drill programme at its Big Red Project in the Fraser Range targeting nickel-copper sulphide mineralisation. The Big Red Project is located 450 kilometres east of Kalgoorlie in the Fraser Range Western Australia.

Rumble has completed 4 Mud Rotary/Diamond drill holes totalling 1,503.9m with the programme designed to test a 2km EM conductor outlined by a high powered ground EM survey.

As previously reported the first hole reached 240m but was abandoned through difficult drilling conditions. Rumble is pleased to announce all three subsequent holes reached target depth and intersected sulphide zones within gabbros of the Fraser Range Complex. These sulphide zones are of considerable widths and indicate this large conductor to be a significant mineralised system. Intersecting mafic gabbro is of significance as it is the rock unit which can host magmatic Ni-Cu sulphide deposits.

Figure 1. Disseminated sulphides in core

### Executives & Management

Mr Shane Sikora  
CEO

Mr Terry Topping  
Executive Director

Mr Andrew McBain  
Non-executive Director

Mr Matthew Banks  
Non-executive Director

Mr Michael Smith  
Non-executive Director

Mr Bruno Seneque  
Company Secretary

The geology of the Big Red project generally consists of felsic and mafic gneisses of the Fraser Range Complex. Previous drilling by Teck Australia intersected thin gabbro units which were age dated to 1.3 billion years old which is the age of the Fraser Range complex. This round of drilling intersected much broader zones of gabbro and more mafic gneisses with the 2 Southern holes BRDD002 and BRDD004 intersecting large disseminated sulphides zones. **No Graphite was intersected.**

**BRDD002** intersected two zones of gabbro, the first from 359.7m to 374.1 contained 14.4m of disseminated sulphides dominated by pyrrhotite and chalcopyrite (copper) towards a mylonitic faulted contact. A second zone was intersected from 386.2m to 399.9m which also intersected 13.7m of sulphides in layered gabbro with similar sulphides towards a mylonitic lower contact zone.

**BRDD003** was drilled some 200m to the North of hole 2 with a thin zone of disseminated pyrrhotite and chalcopyrite from 339.3m to 340.3m along with a thin gabbro unit from 360.7 to 362.5m. This hole is closer to the original Teck hole which contained gabbro with only slightly elevated sulphur and copper.

**BRDD004** was then drilled 300m to the south of BRDD002 which intersected the broadest gabbro unit. Similar to hole BRDD002 to the north. It intersected two units with the upper unit from 183.6 to 190.6 containing disseminated pyrrhotite and chalcopyrite sulphides. A much broader zone was identified from 245.6m to 284.6m containing similar disseminated to blebby sulphides near the lower contact.

## Assays

The Core was logged onsite and is being transported to ALS for cutting, assaying and petrology.

## DHEM - Downhole EM Program

The three holes that reached target have only covered a total strike length of 500 metres. The Company has fast tracked a downhole EM program with DDH1 demobilising its drill rigs offsite to enable the high powered downhole EM (DHEM) program to commence. The DHEM has been planned in all 3 holes with the crew expected to mobilise imminently. The downhole EM will locate areas that have the highest conductance which may represent massive sulphide accumulations which would become high priority drill targets. The Downhole EM can look 100 metres in all directions providing a more accurate target than the ground based EM. As the drilling locations are over 200 metres apart Rumble will be able to cover 700 metres within the target area providing maximum coverage.

## CEO Comments

**CEO of Rumble, Mr Shane Sikora, said** "Intersecting copper sulphides within Fraser Range gabbro units has enhanced the prospectivity of the Big Red Project for both nickel and copper massive sulphides to be present. These sulphide zones are of considerable widths and indicate the conductor to be within a large mineralised system. The 3 drill holes have only tested a small section of the 2km bedrock conductor highlighting the area's potential. We are fast tracking a downhole EM program targeting areas that represent the highest conductance which may represent massive sulphide accumulations. An off hole conductor would represent a compelling target for the next phase of drilling".

Shane Sikora  
CEO

### About Rumble Resources Ltd

Rumble Resources Ltd is an Australian based exploration company, officially admitted to the ASX on the 1st July 2011. Rumble was established with the aim of adding significant value to its current gold and base metal assets and will continue to look at mineral acquisition opportunities both in Australia and abroad.

### Competent Persons Statement

The information in this report that relates to Exploration Results is based on information compiled by Mr Terry Topping, who is a Member of the Australasian Institute of Mining & Metallurgy and the Australian Institute of Geoscientists. Mr Topping is a fulltime employee of Rumble Resources Limited and has sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves". Mr Topping consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

## Section 1 Sampling Techniques and Data

Criteria	JORC Code explanation	Commentary
Sampling techniques	<ul style="list-style-type: none"> <li>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</li> <li>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</li> <li>Aspects of the determination of mineralisation that are Material to the Public Report.</li> <li>In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</li> </ul>	<ul style="list-style-type: none"> <li>Mud Rotary (MR) drilling of Pre-collars to depths between 138.8m to 173.5m</li> <li>HQ and NQ2 Diamond drilling to the Bottom of Hole for four holes. Core collected ranges in length from 67.8m to 284.0m.</li> <li>No sampling of the Diamond core has yet occurred.</li> </ul>
Drilling techniques	<ul style="list-style-type: none"> <li>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc)..</li> </ul>	<ul style="list-style-type: none"> <li>Mud Rotary (MR) drilling of Pre-collars to depths between 138.8m to 173.5m</li> <li>HQ and NQ2 Diamond drilling to the Bottom of Hole for four holes. Core collected ranges in length from 67.8m to 284.0m.</li> <li>Diamond drilling and pre-collars undertaken by DDH1 Drilling, utilizing a multipurpose Sandvik 1200 drill rig and associated equipment.</li> <li>Diamond Core is oriented using an electronic reflex orientation tool at end of each run</li> </ul>
Drill sample recovery	<ul style="list-style-type: none"> <li>Method of recording and assessing core and chip sample recoveries and results assessed.</li> <li>Measures taken to maximise sample recovery and ensure representative nature of the samples.</li> <li>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</li> </ul>	<ul style="list-style-type: none"> <li>Diamond drilling recoveries are recorded by the drillers at the end of each drilling run and checked during logging by Rumbles field staff</li> </ul>
Logging	<ul style="list-style-type: none"> <li>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</li> <li>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</li> <li>The total length and percentage of the relevant intersections logged.</li> </ul>	<ul style="list-style-type: none"> <li>The Diamond core has been geologically logged to a level of detail to be appropriate for mineral resource estimation.</li> <li>Logging of diamond core records lithology, mineralogy, mineralization, weathering, colour and other appropriate features.</li> <li>All logging is quantitative. All core trays photographed.</li> <li>All the diamond core (100%), totalling</li> </ul>

Criteria	JORC Code explanation	Commentary
		880.1m has been orientated and geologically logged.
Sub-sampling techniques and sample preparation	<ul style="list-style-type: none"> <li>If core, whether cut or sawn and whether quarter, half or all core taken.</li> <li>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</li> <li>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</li> <li>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</li> <li>Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</li> <li>Whether sample sizes are appropriate to the grain size of the material being sampled.</li> </ul>	<ul style="list-style-type: none"> <li>Not applicable. Core still remains to be cut and sampled</li> </ul>
Quality of assay data and laboratory tests	<ul style="list-style-type: none"> <li>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</li> <li>For geophysical tools, spectrometres, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</li> <li>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</li> </ul>	<ul style="list-style-type: none"> <li>Not applicable. Core still remains to be cut and sampled</li> </ul>
Verification of sampling and assaying	<ul style="list-style-type: none"> <li>The verification of significant intersections by either independent or alternative company personnel.</li> <li>The use of twinned holes.</li> <li>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</li> <li>Discuss any adjustment to assay data.</li> </ul>	<ul style="list-style-type: none"> <li>Not applicable.
