

23 January 2019

Key Points *(All figures expressed in Australian dollars unless stated otherwise)*

- Quarterly **gold production of 90,487 ounces** (Sep 18: 90,879 ounces) in line with the previous quarter and above the midpoint of FY19 guidance.
- **114,966 ounces** of gold sold at an average price of **\$1,718** per ounce during the quarter.
- Pre-royalty **cash cost (CC) for the quarter of \$765** per ounce and **all in sustaining cost (AISC) of \$985 per ounce** (Sep 18: CC \$793/oz & AISC \$923/oz) at the lower end of FY2019 guidance.
- **First half production of 181,366 ounces** is at the top end of annual guidance with AISC of **\$954 per ounce** well below the lower end of cost guidance.
- Cash and bullion of **\$206.7 million** at the end of the quarter, an **increase of \$16.7 million** from the previous quarter with operating cash flow of \$76.4 million, mine development and capital expenditure of \$27.6 million, exploration expenditure of \$11.0 million and income tax payments of \$18.4 million.
- **Rosemont underground** mining contract awarded to Barminco. Portal preparation completed and underground development to commence by the end of March 2019 quarter.
- Exciting drilling results continue from **Rosemont underground** with results from the targeted **Central zone** including **4m @ 26.1 g/t, 12m @ 6.8 g/t, 8m @ 27.7 g/t and 16m @ 6.8 g/t** all of which are outside the current Underground Resource envelope. Drilling confirming continuity of gold mineralisation over a strike length of at least 2km and still open down plunge.
- Drilling results at **Garden Well underground** target also showing pleasing results including **5m @ 15.3g/t**.
- **McPhillamys** Environmental Impact Statement (EIS) and Definitive Feasibility Study (DFS) work streams continue and the Community Consultative Committee established.
- Latest Drilling programme at **Discovery Ridge** completed with very good results including **109 metres @ 1.6 g/t and 94m @ 2.6 g/t** and still open at depth.
- **Guidance** for the FY19 year remains unchanged with gold production in the mid to upper range of **340,000-370,000 oz** and AISC at the lower end of guidance between **\$985-1055/oz**.

Comment

Regis Resources Managing Director, Jim Beyer, said: "I am very pleased to report that the Regis team has again delivered a very robust set of results not just on the operations front but also in our life blood, exploration activities.

"Gold production has continued as planned and our All in Sustaining Costs (AISC) for the year to date are slightly better than expectations. This strong performance is providing us with confidence that for the current financial year Regis' production will be at the mid to upper end of our guidance range (340,000-370,000 oz) and our AISC costs coming in at the lower end of guidance (\$985-1055/oz).

"Looking beyond this year's production we are very pleased to be getting started on the development mining for our high grade Rosemont underground project. On our current schedules we are expecting this new high grade ore source to be increasing our gold production rates by the end of this year and continuing this trend for at least the following three years. Our expectations of success in extending the life of the underground is already appearing to be coming to fruition with more exceptional high-grade intercepts in new areas and even with this drilling the Rosemont orebody is still open at depth.

"In New South Wales, the team continued working on the complex and detailed requirements for the EIS required for the Development Approval application and the DFS for our 2Moz reserve, 10 year, McPhillamys project. We were also very pleased to potentially add further value with the continuing excellent results from the drilling we have been undertaking on the nearby satellite Discovery Ridge deposit.

"Our exploration team also continued to see high grade intercept results at Garden Well below the open pit. This target is the next in the lengthy list of high potential underground mining areas after Rosemont that our team has identified across Regis' projects in the Duketon Greenstone Belt.

"In summary the good start to our production year has continued, while the execution of our exploration strategy to increase our mine life and production profile is continuing to deliver excellent results."

DUKETON OPERATIONS

The Duketon Gold Project, located in Western Australia, achieved another quarter of strong operations with 90,487 ounces of gold produced in the December 2018 quarter (Sep 18: 90,879 ounces). This production is in line with the previous quarter and above the midpoint of annual production guidance.

The cash cost before royalties for the quarter was \$765 per ounce and the all in sustaining cost (AISC) of \$985 per ounce was at the bottom end of the annual guidance range.

Operations have achieved a half year production of 181,366 ounces at an AISC of \$954 per ounce, well below annual cost guidance. Operating results summarised in Table 1 below

	FY 19 December Quarter			FY19Q1
	DNO	DSO	TOTAL	Total
Ore mined (Mbcm)	0.5	0.6	1.1	1.4
Waste mined (Mbcm)	1.4	5.4	6.8	6.3
Stripping ratio (w:o)	2.8	8.4	6.0	4.4
Ore mined (Mtonnes)	1.1	1.7	2.8	3.0
Ore milled (Mtonnes)	0.8	1.5	2.3	2.6
Head grade (g/t)	0.96	1.51	1.32	1.17
Recovery (%)	92.2%	94.7%	94.1%	93.3%
Gold production (ounces)	22,174	68,313	90,487	90,879
Cash cost (A\$/oz)	876	729	765	793
Cash cost inc royalty (A\$/oz)	957	817	851	854
All in Sustaining Cost (A\$/oz) ¹	941	1,000	985	923

¹ AISC calculated on a per ounce of production basis

Table 1: Operating results for the Regis group for the December 2018 quarter

Duketon Northern Operations (DNO)

DNO produced 22,174 ounces of gold at an AISC of \$941 per ounce in the December 2018 quarter. Production was down from the previous quarter as a result of decreases in processed head grade and throughput at the Moolart Well mill. The processed head grade is expected to lift slightly and be in the order of 1.0g/t for the March 2019 quarter which is in line with the reserve grade of the project. The mill throughput has been reducing as the current main ore source from Gloster makes the transition into the harder fresh rock.

Mining volumes were down on the previous quarter as the mining fleet was redirected to carry out planned pre-production mining activities at the Dogbolter and Anchor deposits. The stripping ratio in the DNO increased slightly to 2.8:1 in the December 2018 quarter as a result of the planned mining sequence.

The lower production and higher stripping ratio increased the AISC approximately 5% higher than the previous quarter at \$941 per ounce. This is in line with guidance expectations.

Duketon Southern Operations (DSO)

DSO produced 68,313 ounces of gold at an AISC of \$1,000 per ounce in the December 2018 quarter.

Gold production at DSO was higher than the previous quarter due to an increase in processed head grade and mill recovery as a result of the ore feed from Tooheys Well commencing during the quarter. Throughput was marginally impacted by lower availability from a scheduled mill reline and major mill shutdown.

Mining volumes were up 8% compared to the previous quarter as a result of improved equipment utilisation allowing additional waste movement at Tooheys Well. As a result, strip ratio's at DSO increased to 8.4 in the December 2018 quarter.

The higher strip ratios across the project area and the commencement of construction of an additional tailings storage facility near Tooheys Well increased the AISC by approximately 7% to \$1,000 per ounce. This cost is in line with guidance expectations.

CORPORATE

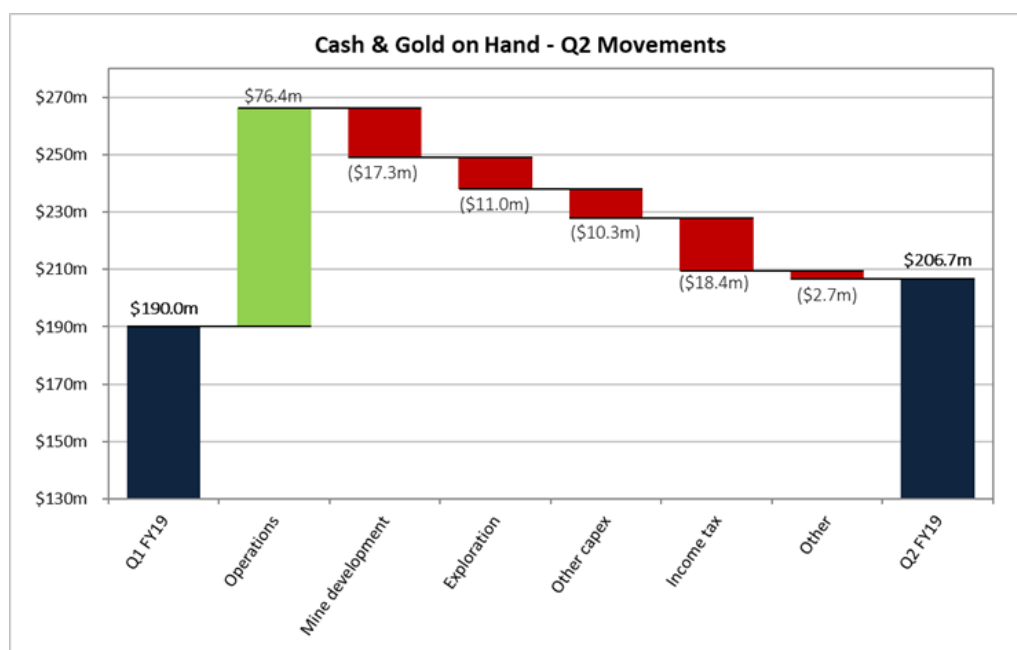

Cash Position and Gold Sales

The Duketon project generated operating cash flow of \$76.4 million in the December 2018 quarter in line with the \$77.9 million recorded in the previous quarter. During the quarter, Regis sold 114,966 ounces of gold at an average price of A\$1,718 per ounce up from 71,310 ounces at A\$1,660 per ounce in the September 2018 quarter. The increase in gold sales in the December 2018 quarter is due to the significant gold on hand balance carried over from the September 2018 quarter. The gold on hand at the end of September 2018 was 34,331 ounces and after selling down from this high level, the gold on hand at the end of December 2018 was 10,625 ounces which is more consistent with historic levels.

The Company delivered gold into a combination of spot deferred contracts and at the prevailing spot price during the December 2018 quarter. The total hedging position at the end of the quarter was 420,120 ounces of forward contracts with an average delivery price of A\$1,574 per ounce. Following the completion of the December 2018 quarter the Company took advantage of the strong AUD gold price by adding a further 50,000 ounces of short term forward contracts with a delivery price of A\$1860 per ounce. In addition, the Company sold a gold call option early in January 2019 for 25,000 ounces, expiring 28 June 2019 at a strike price of \$1830 per ounce.

At the end of the quarter Regis had \$206.7 million in cash and bullion, an increase of \$16.7 million from the \$190.0 million held at 30 September 2018 after the payment of \$11.1 million on pre-stripping of new and existing satellite projects, \$11.0 million on exploration and feasibility projects, \$18.4 million on income tax payments including \$9.6 million final FY2018 tax payment, \$2.3 million on TSF development, \$1.9 million on long lead items for Rosemont Underground and \$1.3 million on additional crushing capacity at Gloster.

Graph 1 Illustrates the movement in Regis' cash reserves over the quarter.

Graph 1. Waterfall graph illustrating the key changes in the cash and gold from Q1 to end Q2.

Production and Cost Guidance

Gold production at Duketon in the second half of FY2019 is expected to be broadly in line with the first half production. As a result of this solid performance our full year production for FY2019 is expected to be at the mid to upper end of the annual production guidance of 340,000-370,000 ounces and at the mid to lower end of annual AISC guidance of \$985-\$1,055 per ounce.

ROSEMONT UNDERGROUND PROJECT

During the September 2018 quarter the Company announced that the Board had made a decision to invest in the development of an underground mining operation at the current Rosemont open pit operation. The decision was made on the basis of a detailed mining study which assessed the mining of the maiden underground resource at Rosemont of 1.4mt at 5.1 g/t for 230,000 ounces of gold. These initial tonnes are expected to be mined over a three year period commencing in the latter half of 2019.

Progress in the planning for the underground mining at the current Rosemont open pit operation continued in the December 2018 quarter with finalisation of the key elements of the permitting process completed.

The initial portal position in to the southern end of the Rosemont Main open pit was prepared ready for underground development work to commence in the March 2018 quarter. See Figure 1.

The installation of offices, changerooms and expanded emergency response facilities for the underground project commenced in the December 2018 quarter and will be completed in the current quarter. Work on the expanded camp which commenced in the September quarter continued in line with schedule requirements.

The mining contract tender process was significantly advanced during the quarter and subsequent to the end of the December quarter an initial 3-year contract with Barminco was awarded and signed. See ASX release 21 January 2019. Mobilisation is currently underway and decline development mining is expected to start in March 2019.

Additional drilling carried out during the December 2018 quarter will be utilised to reoptimise the resource with the expectation of some of the resource being upgraded to Indicated Resources. Mine plans and schedules will also be recast during the March 2019 quarter and will be used to form the basis of forecast production and costs for the Rosemont operation for the coming financial year.

Figure 1. Rosemont Portal prepared for commencement of underground development.

McPHILLAMYS GOLD PROJECT

The 100% Regis owned McPhillamys Gold Project (MGP), located in New South Wales, is one of Australia's larger undeveloped open pitable gold resources. The project is located 250 kilometres west of Sydney in a well-established mining district. In September 2017 Regis reported a reserve of 60.1 Mt @ 1.05 g/t Au for 2.03 Moz.

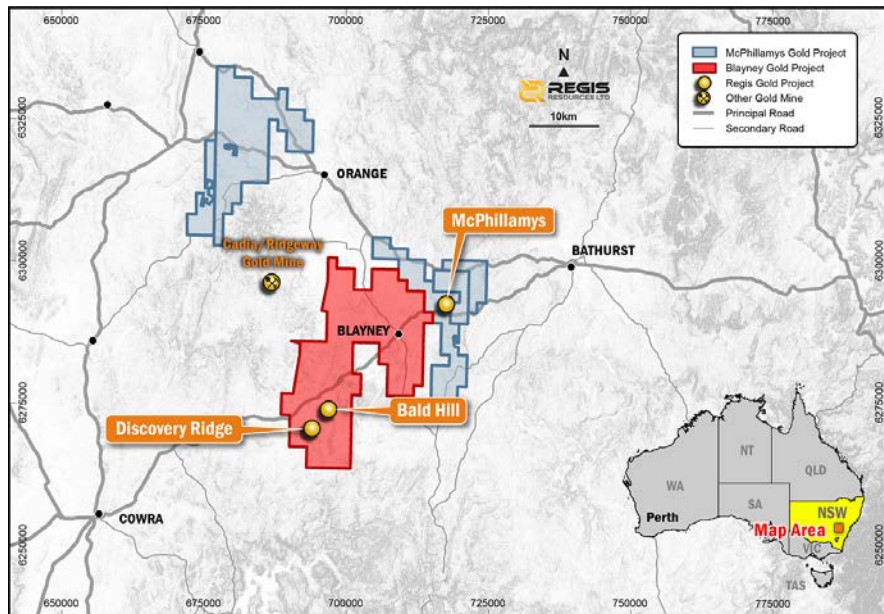

Figure 2. McPhillamys Gold Project location including the Blayney tenement and the Discovery Ridge Project location.

Environmental Impact Statement

As noted previously the Company received the Environmental Assessment Requirements (EARs) issued by the NSW Department of Planning and Environment (DPE) late in the September 2018 quarter. After consideration of these requirements and the detailed work required to satisfy them, it is currently expected that the Company will be in a position to submit the final EIS to the DPE in the June 2019 quarter.

The Community Consultative Committee (CCC) was established and the first meeting held late in the December 2018 quarter. This forum is for discussion of specific issues relating to the development and operation of this State Significant Project with Company, community and local Council representatives.

As part of the EIS work, Regis has continued its community consultation through meetings, the distribution of community information sheets and a number of community open days for the local and wider community.

Process Water Supply

Regis is continuing to progress the pipeline route access to utilise recycled water from the Mt Piper Power Station and Centennial Mine near Lithgow. This is one of the two long term water supply options for the project. Finalisation of a formal water offtake agreement with Centennial Coal Company Limited ("Centennial") and Energy Australia Pty Ltd ("EA") for Regis to utilise this water is progressing.

Regis also continues to hold approximately 4.5GLpa of ground water access licences in a zone of the Lachlan catchment, approximately 80 kilometres from MGP as an alternative water supply.

Definitive Feasibility Study, Development Timetable and outlook

Work continued on the Definitive Feasibility Study (DFS). The DFS will incorporate the requirements for project development emanating from the results of the EIS and will further define operating parameters, estimated capital and operating costs and a development timetable (subject to completion of permitting). The DFS will be completed subsequent to the submission of the EIS.

McPhillamys' Satellite Discovery Ridge Gold Deposit

As flagged previously the DFS will consider the very exciting Discovery Ridge satellite project (located 32 kilometres away from MGP) where recent drilling is confirming the significant potential of this project. Discovery Ridge is shaping as a significant satellite project to the MGP as a significant additional high grade ore production source and hence value enhancer for the project.

Exploration work conducted during the quarter included 1,551m of diamond drilling to infill and test the down plunge extension to gold mineralisation at Discovery Ridge. This work will contribute to a JORC 2012 compliant resource and reserve estimate to be completed for the annual reserve statement released later this year.

Significant drilling results from RRLDRDD016 and RRLDRDD018 drilled 20m south of RRLDRDD014, reported in the September 2018 quarter, confirms a broad zone of gold mineralization 50m wide is open at depth, down plunge to the north. Significant results for the December quarter include:

- 15m @ 1.7 g/t Au from 247 to 262m RRLDRDD016
- 94m @ 2.6 g/t Au from 377 to 471m RRLDRDD016
- 109m @ 1.6 g/t Au from 281 to 390m RRLDRDD018

The cross section in Figure 3 below illustrates the location of the December 2018 quarter intercepts.

These intercepts continue the exceptional results of the deeper intercepts previously reported in the September 2018 quarter and noted again below. A preliminary technical assessment of these strong deeper intercepts is supporting an underground concept study which will be considered in due course.

- 162m @ 2.0 g/t Au from 338 to 500m RRLDRDD014
 - Including 54.5m @ 3.9 g/t Au from 353m
- 65m @ 2.05 g/t Au from 326 to 391m RRLDRDD013
 - Including 12m @ 5.84 g/t Au from 343m

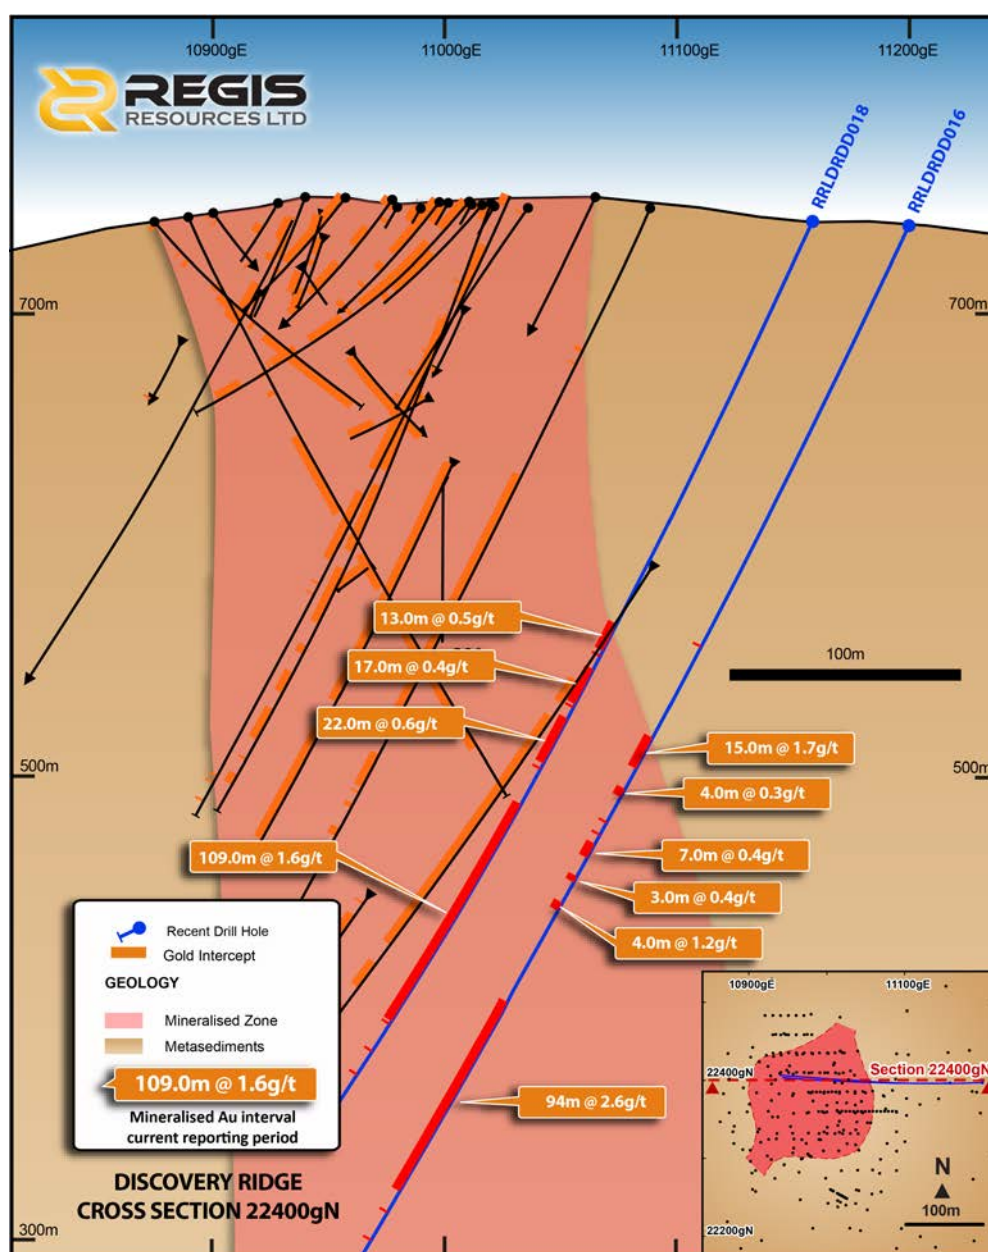

Figure 3. Discovery Ridge cross section 22400gN and new drill intercepts for the December quarter.

DUKETON EXPLORATION

Regis controls a significant tenement package across the majority of the Duketon Greenstone Belt (DGB). The tenement holding encompasses 200 granted exploration, prospecting and mining leases, across 1,047km².

During the December 2018 quarter a total of 58,583m of drilling was completed. This work mostly focused on extension to the underground resource at Rosemont and resource infill drilling at Moolart Well. Near mine exploration drilling was also conducted across some key project areas. Figure 4 below shows where drilling of satellites deposits occurred during the December quarter.

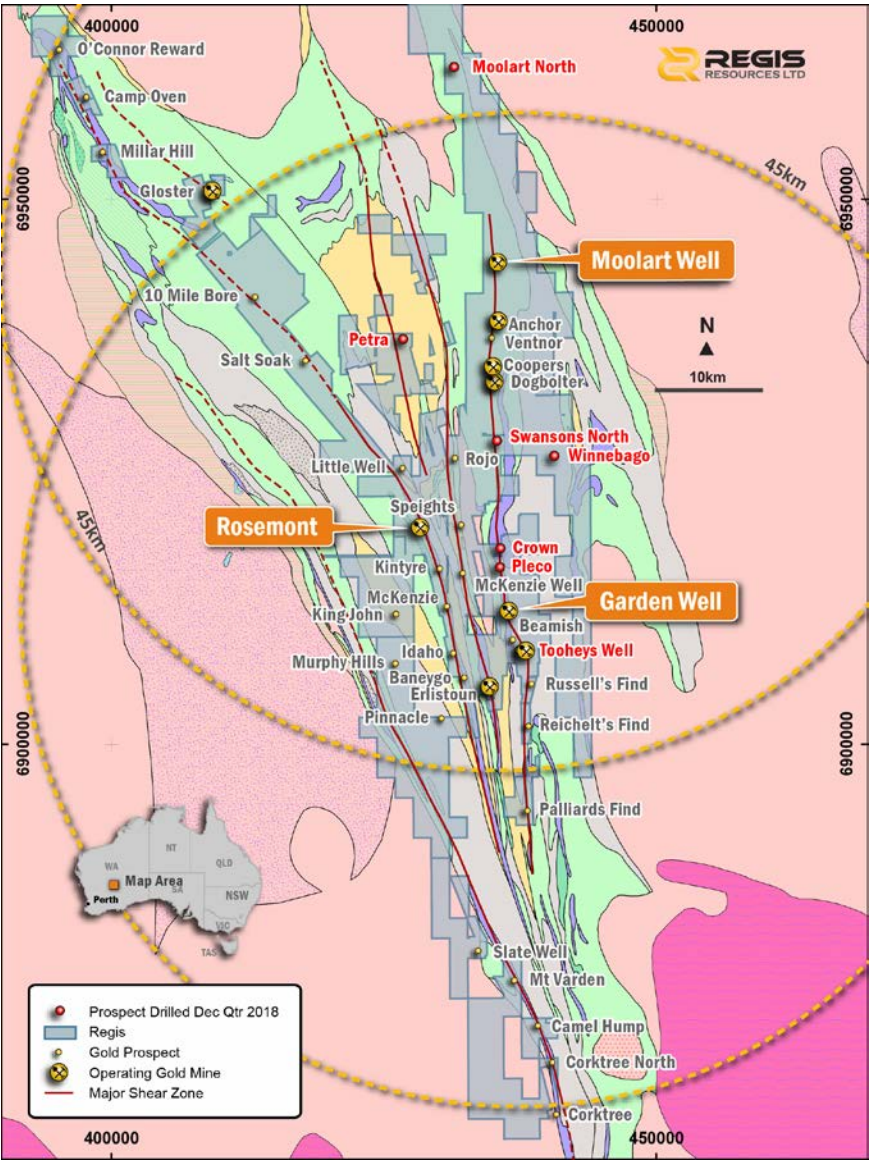

Figure 4. Satellite deposits and gold prospects of the Duketon tenement package. Prospects marked in red were drilled this quarter.

Summary of Key Assay Results Received:

Rosemont – Underground

At the Rosemont underground project diamond drilling (DD) and reverse circulation (RC) drilling encountered significant intercepts in the central zone outside the current Underground Resource envelope with sufficient thickness and tenor for underground development. These intercepts confirm continuity of gold mineralisation within the quartz dolerite over a strike length of 2km. Gold mineralisation remains open along strike and down plunge.

3 metres @ 23.3 g/t gold from 392 to 395m	3 metres @ 12.8 g/t gold from 400 to 403m
4 metres @ 26.1 g/t gold from 400 to 404m	12 metres @ 6.8 g/t gold from 456 to 468m
2 metres @ 85.6 g/t gold from 420 to 422m	3 metres @ 24.1 g/t gold from 461 to 464m
8 metres @ 27.7 g/t gold from 418 to 426m	16 metres @ 6.8 g/t gold from 462 to 478m

All hole azimuths and dips are in Appendix 2 to this report. All intercepts calculated using a 2.0 g/t lower cut, no upper cut, maximum 2m internal dilution. All RC assays above determined on 1m split samples by fire assay.

Garden Well – Underground

Diamond drilling at Garden Well Gold Mine continued testing the potential of the high grade gold shoot below the southern end of the pit design for underground development. Diamond drilling continues to return very encouraging intercepts including:

5 metres @ 15.3 g/t gold from 462 to 467m	9 metres @ 3.7 g/t gold from 388 to 397m
11 metres @ 3.8 g/t gold from 323 to 334m	

All hole azimuths and dips are in Appendix 2 to this report. All intercepts calculated using a 2.0 g/t lower cut, no upper cut, maximum 2m internal dilution. All Diamond drill assays determined on half core (NQ2) samples by fire assay.

Moolart Well – Open Pit

AC and RC drilling at Moolart Well continued targeting mineralisation below current pit design (for resource & reserve updates) has also returned very encouraging intercepts including:

2 metres @ 33.3 g/t gold from 88 to 90m	7 metres @ 21.8 g/t gold from 90 to 97m
8 metres @ 5.3 g/t gold from 97 to 105m	8 metre @ 3.5 g/t gold from 86 to 94m

All hole azimuths and dips are in Appendix 2 to this report. All intercepts calculated using a 0.5 g/t lower cut, no upper cut, maximum 2m internal dilution. All assays determined on 1m split samples by fire assay.

Baneygo Area – Open Pit

RC drilling at the Baneygo project targeting mineralisation along strike and at depth to extend current pit designs has also returned very encouraging intercepts including:

9 metres @ 10.9 g/t gold from 11 to 20m	8 metres @ 3.0 g/t gold from 70 to 78m
---	--

All hole azimuths and dips are in Appendix 2 to this report. All intercepts calculated using a 0.5 g/t lower cut, no upper cut, maximum 2m internal dilution. All assays determined on 1m split samples by fire assay.

Duketon Exploration Detailed Discussion:

Rosemont Underground Resource

DD and RC drilling continued at Rosemont during the quarter with a view to both infill and extend the Maiden Inferred Underground (UG) Resource of 1.4 Mt @ 5.1 g/t gold for 230 k oz. The resource is contained within a quartz dolerite unit and consists of two mineralised areas located 750m apart: Rosemont Main 0.4 Mt @ 7.2 g/t for 102 k oz; and Rosemont South 1.0 Mt @ 4.1 g/t for 128 k oz.

The drilling focused on the central zone located between the defined underground resource areas with the aim to extend the current resource from the Main domain to the South domain. See Figure 5 below. The drilling has been very successful in identifying high grade gold mineralisation between existing underground resource areas over 750m strike outside the current UG resource envelope with sufficient thickness and tenor for underground development. RC drilling also continued at Rosemont South targeting down plunge continuity of gold mineralisation below current UG stope designs and confirmed the deposits are still open at depth.

Drilling at Rosemont will continue in the current quarter with a strong focus continuing to define new high-grade shoots within the sub-vertical quartz dolerite unit (that varies in thickness from 5 metres to >100m wide) in the central zone and extending existing resources along strike and at depth below the current Underground Resource envelopes.

Assays were received for 53 RC holes. Significant results were received for both resource extension and exploration RC drilling at Rosemont during the quarter. The following results are located outside the current Underground Resource envelope with the exception of *RC831 and *RC861:

• 3m @ 23.3 g/t Au from 392 to 395m	RRLRMRC829 (south domain)
• 5m @ 6.0 g/t Au from 439 to 444m	RRLRMRC830 (south domain)
• 2m @ 31.2 g/t Au from 314 to 316m	RRLRMRC831 (south domain)
• 2m @ 85.6 g/t Au from 420 to 422m	RRLRMRC840 (central zone)
• 4m @ 8.5 g/t Au from 136 to 140m	RRLRMRC841 (central zone)
• 3m @ 12.8 g/t Au from 400 to 403m	RRLRMRC843 (central zone)
• 5m @ 6.0 g/t Au from 419 to 424m	RRLRMRC843 (central zone)
• 3m @ 24.1 g/t Au from 461 to 464m	RRLRMRC845 (central zone)
• 4m @ 26.1 g/t Au from 400 to 404m	RRLRMRC849 (central zone)
• 12m @ 6.8 g/t Au from 456 to 468m	RRLRMRC850 (central zone)
• 8m @ 27.7 g/t Au from 418 to 426m	RRLRMRC851 (central zone)
• 16m @ 6.8 g/t Au from 462 to 478m	RRLRMRC853 (central zone)
• 5m @ 5.1 g/t Au from 196 to 201m	RRLRMRC861 (main domain)
• 3m @ 13.7 g/t Au from 90 to 93m	RRLRMRC862 (central zone)

All hole azimuths and dips are in Appendix 2 to this report. All intercepts calculated using a 2.0 g/t lower cut, no upper cut, maximum 2m internal dilution. All assays determined on 1m split samples by fire assay.

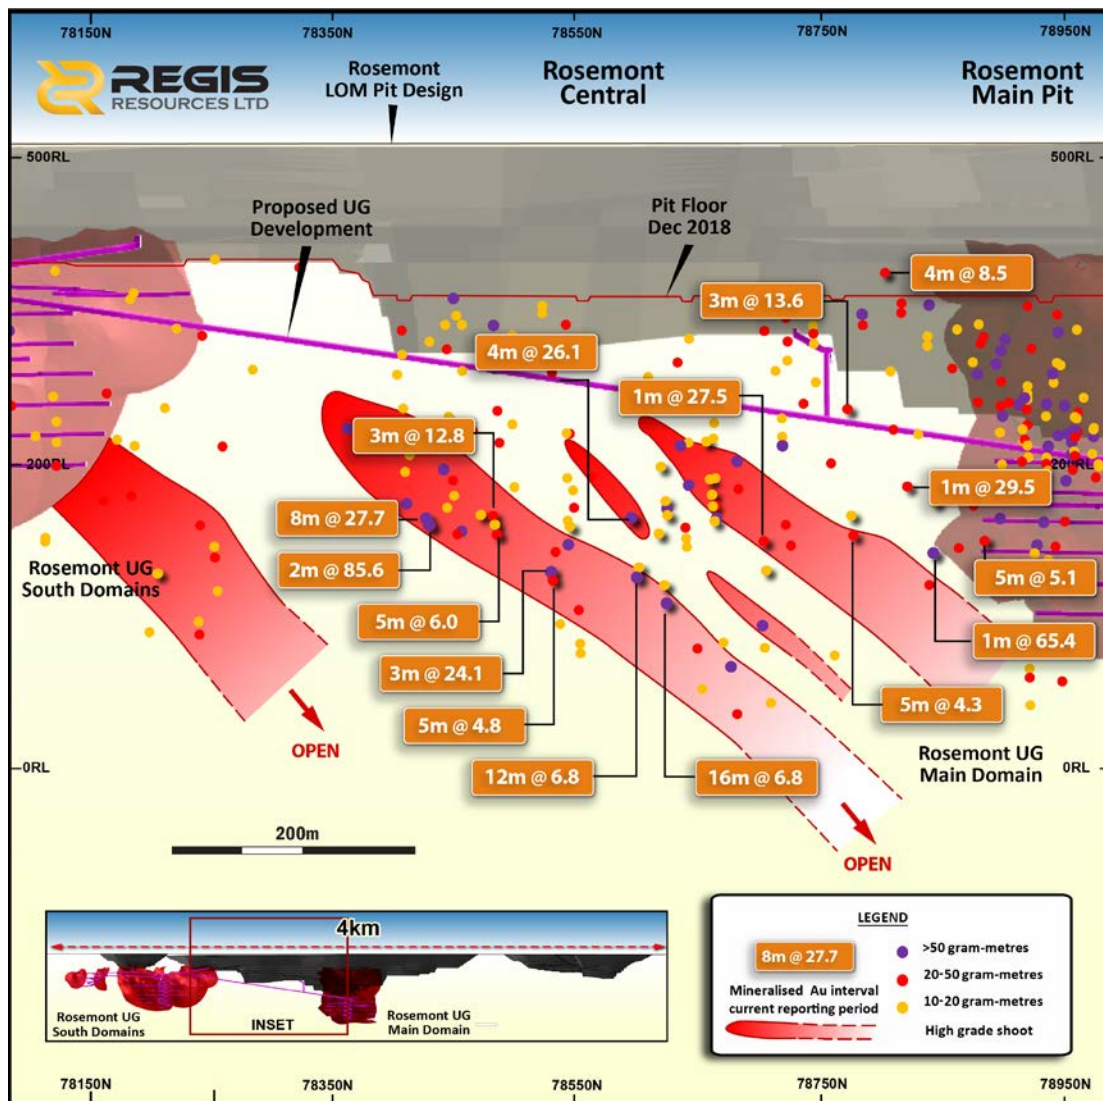

Figure 5. Long Section looking west shows final pit design and new drill intercepts in relation to currently proposed UG development. Note inset showing the location relative to existing planned development.

Garden Well Underground Project

Diamond drilling continued at the southern end of Garden Well open pit mine to test the down plunge continuity of high grade gold mineralisation located to the south and below the final pit design and to reduce drill spacing from 40m x 40m to 40m x 20m.

The southern high grade shoots measure 4-10m true width across strike and up to 200 metres north-south along strike. The zones of mineralisation sit between 100-350m below surface, dip to the east, and are open at depth to the south. See Figure 6 below. Previous drilling along strike has also identified several high-grade shoots beneath the pit to the north. This deep drilling programme will continue in 2019 to define the extent of the southern high-grade shoots along strike and down plunge.

Drilling during the quarter was designed to test the southern high grade shoot between 200m and 400m below surface. A total of 9 DD holes (RRLGDDD122-130) were completed for 3,546 metres.

Results continue to show significant widths and grades of gold mineralisation and indicate the potential for a robust underground target below the southern end of the open pit. Significant results from diamond drilling for the December quarter include:

- 5m @ 15.3 g/t Au from 462 to 467m RRLGDDD120
- 9m @ 3.7 g/t Au from 388 to 397m RRLGDDD121
- 11m @ 3.8 g/t Au from 322.8 to 333.5m RRLGDDD122

Hole azimuths and dips for all holes are in Appendix 2 to this report. All intercepts calculated using a 2.0 g/t lower cut, no upper cut, maximum 2m internal dilution. All assays determined on 1m split samples by fire assay.

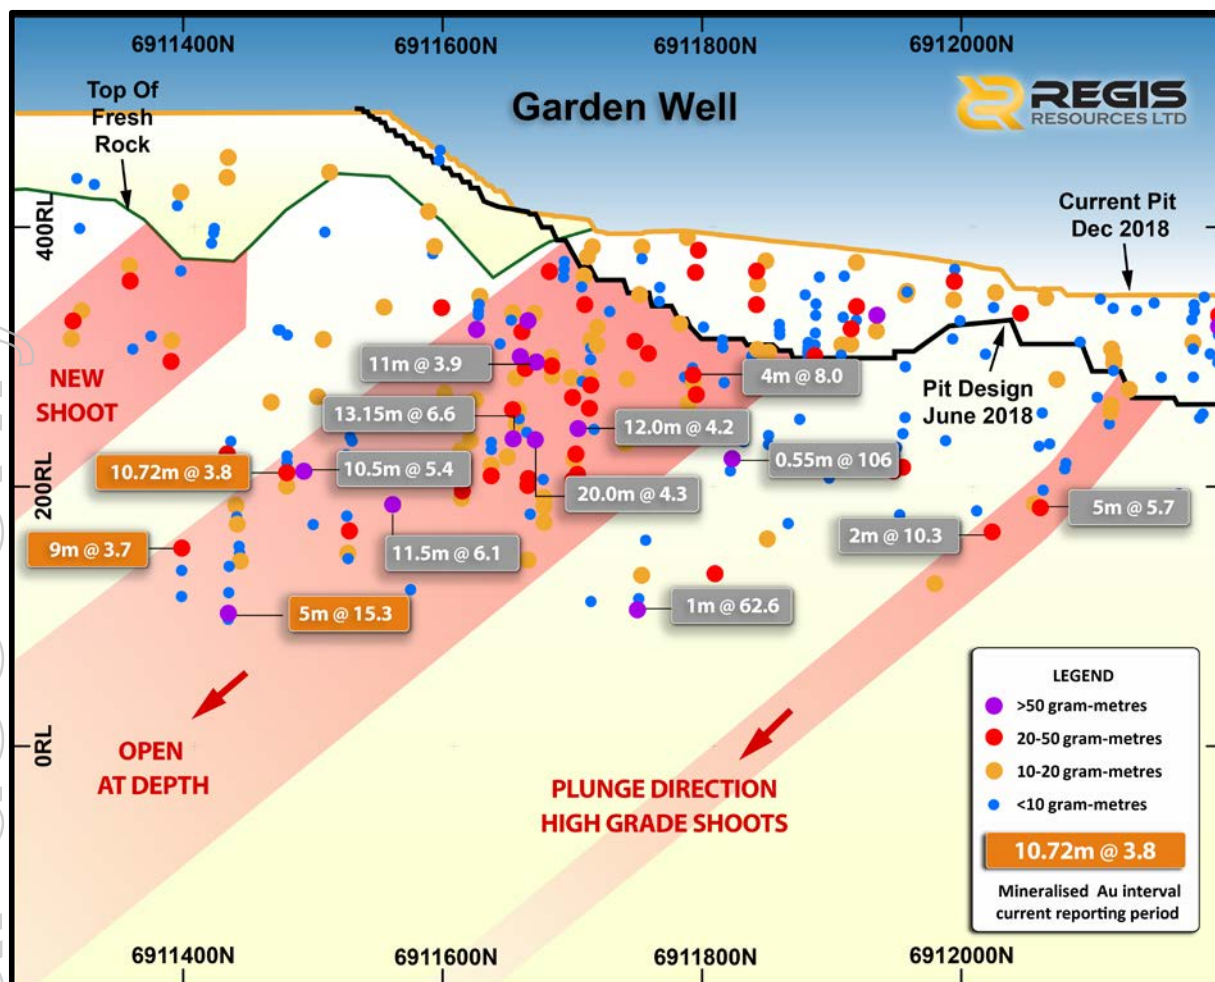

Figure 6. Long section looking west. Section showing high grade intercepts beneath the final pit

Moolart Well Gold Mine

An extensive AC and RC drill programme continued during the December 2018 quarter at Moolart Well aiming to:

- test for shallow oxide resources;
- test down dip extensions of gold mineralisation beneath existing pits; and
- increase the drill density in the existing resource envelopes in order to convert additional resources to reserves.

During the current quarter a total of 153 AC and 54 RC holes for 21,833m were completed. Significant results received during the current quarter include:

- | | |
|-------------------------------------|--------------|
| • 2m @ 33.3 g/t Au from 88 to 90m | RRLMWAC3210* |
| • 7m @ 21.8 g/t Au from 90 to 97m | RRLMWRC1747 |
| • 18m @ 1.5 g/t Au from 193 to 211m | RRLMWRC1754 |
| • 13m @ 2.0 g/t Au from 131 to 144m | RRLMWRC1757 |
| • 23m @ 1 g/t Au from 144 to 167m | RRLMWRC1758 |
| • 17m @ 1.3 g/t Au from 128 to 145m | RRLMWRC1761 |
| • 8m @ 5.3 g/t Au from 97 to 105m | RRLMWRC1766 |
| • 15m @ 1.4 g/t Au from 233 to 248m | RRLMWRC1779* |
| • 8m @ 3.5 g/t Au from 86 to 94m | RRLMWRC1790 |
| • 9m @ 2.8 g/t Au from 115 to 124m | RRLMWRC1790 |

* Results are outside the current quoted resource shell.

Hole azimuths and dips for all holes are in Appendix 2 to this report. All intercepts calculated using a 0.5 g/t lower cut, no upper cut, maximum 2m internal dilution. All assays determined on 1m split samples by fire assay.

Resource updates and pit optimisations will be completed on the drilled areas with a view to adding to the mining reserves at the Moolart Well operation.

Gold mineralisation in fresh rock at Moolart Well is largely untested and presents as a highly prospective target. Exploration during 2019 will focus on developing a robust geological model for Moolart Well in order to target gold mineralisation beneath the existing open pits, and to investigate the potential for underground resources.

Baneygo Area Project

The Baneygo Area Gold Project is located 15 kilometres to the south and along strike of the Rosemont Gold Mine and currently has a total resource of 11 Mt @ 0.96 g/t Au for 340,380 oz. including reserves of 4 Mt @ 1.22 g/t Au for 158,000 oz. Gold mineralisation at Baneygo area extends over 2.5 strike kms and is hosted in quartz dolerite which has intruded a sequence of mafic-ultramafic-sedimentary units. The deposit is similar in style to the Rosemont Gold deposit, with gold mineralisation confined to the quartz dolerite.

Very encouraging results were received from drilling immediately north of the existing resource shell. These included:

• 8m @ 3.0 g/t Au from 70 to 78m	RRLIHRC234
• 5m @ 6.0 g/t Au from 33 to 38m	RRLMKRC031
• 2m @ 7.5 g/t Au from 91 to 93m	RRLMKRC033
• 1m @ 12.1 g/t Au from 27 to 28m	RRLMKRC038
• 9m @ 7.4 g/t Au from 31 to 40m	RRLMKRC047
• 8m @ 1.3 g/t Au from 30 to 38m	RRLMKRC048
• 8m @ 5.9 g/t Au from 71 to 79m	RRLMKRC051
• 6m @ 5.1 g/t Au from 72 to 78m	RRLMKRC056
• 3m @ 3.5 g/t Au from 45 to 48m	RRLMKRC058
• 7m @ 2.5 g/t Au from 51 to 58m	RRLMKRC058

Hole azimuths and dips for all holes are in Appendix 2 to this report. All intercepts calculated using a 0.5 g/t lower cut, no upper cut, maximum 2m internal dilution. All assays determined on 1m split samples by fire assay.

These intercepts confirm gold mineralisation extends 380m north of the current quoted resource shell.

Drilling at Baneygo to date has focused on shallow oxide gold mineralisation. The extent of gold mineralisation at depth in fresh rock remains largely untested. A programme of deeper drilling will be conducted in the March quarter to assess the continuity of historic high grade intercepts in fresh rock, all outside current reserves.

Other Duketon Belt Prospects

Exploration continued in the December 2018 quarter across other regional target areas to define additional satellite deposits close to existing infrastructure and to test high priority regional targets.

The most encouraging results were received for:

Crown Prospect located 3.5km north along strike of Garden Well Mine:

• 6m @ 1.2 g/t Au from 33 to 39m	RRLCRNRC003
• 2m @ 6.0 g/t Au from 61 to 63m	RRLCRNRC003
• 5m @ 1.7 g/t Au from 9 to 14m	RRLCRNRC004
• 5m @ 1.0 g/t Au from 33 to 38m	RRLCRNRC010
• 2m @ 2.1 g/t Au from 44 to 46m	RRLCRNRC013

Russells Find (south) located 8km south of Garden Well Mine:

• 12m @ 1.2 g/t Au from 56 to 68m	RRLRFRC132
• 3m @ 3.5 g/t Au from 85 to 88m	RRLRFRC134
• 8m @ 1.3 g/t Au from 13 to 21m	RRLRFRC135
• 15m @ 1.6 g/t Au from 37 to 52m	RRLRFRC136
• 10m @ 2.1 g/t Au from 42 to 52m	RRLRFRC140

Ventnor located 8km south of Moolart Well Mine:

• 12m @ 1.1 g/t Au from 64 to 76m	RRLVNAC093
• 8m @ 2.5 g/t Au from 72 to 80m	RRLVNAC106

Anomalous assays received for other gold prospects drilled during the September and December 2018 quarter are included in Appendix 2.

COMPETENT PERSON STATEMENT

The information in this report that relates to exploration results is based on and fairly represents information and supporting documentation that has been compiled by Ms Tara French who is a member of the Australian Institute of Geoscientists. Ms French has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which she is undertaking to qualify as a Competent Person as defined in the 2012 edition of the 'Australasian Code for the Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Ms French is a full time employee of Regis Resources Ltd and consents to the inclusion in the report of the matters based on her information in the form and context in which it appears.

The information in this report that relates to the Company's Resources and Ore Reserves is extracted from the ASX announcement released on 27 July 2018 entitled "Mineral Resource and Ore Reserve Statement as at 31 March 2018" and for which Competent Person's consents were obtained.

The reports are available to view on the ASX website and on the Company's website at www.regisresources.com.au. The Company confirms it is not aware of any new information or data that materially affects the information included in the original market announcement, and, in the case of estimates of Mineral Resources and Ore Reserves, that all market assumptions and technical assumptions underpinning the estimates in the relevant market announcement continue to apply and have not materially changed.

The Competent Person's consents remain in place for subsequent releases by the Company of the same information in the same form and context, until the consent is withdrawn or replaced by a subsequent report and accompanying consent.

FORWARD LOOKING STATEMENTS

This ASX announcement may contain forward looking statements that are subject to risk factors associated with gold exploration, mining and production businesses. It is believed that the expectations reflected in these statements are reasonable but they may be affected by a variety of variables and changes in underlying assumptions which could cause actual results or trends to differ materially, including but not limited to price fluctuations, actual demand, currency fluctuations, drilling and production results, Reserve estimations, loss of market, industry competition, environmental risks, physical risks, legislative, fiscal and regulatory changes, economic and financial market conditions in various countries and regions, political risks, project delay or advancement, approvals and cost estimates.

Forward-looking statements, including projections, forecasts and estimates, are provided as a general guide only and should not be relied on as an indication or guarantee of future performance and involve known and unknown risks, uncertainties and other factors, many of which are outside the control of Regis Resources Ltd. Past performance is not necessarily a guide to future performance and no representation or warranty is made as to the likelihood of achievement or reasonableness of any forward looking statements or other forecast.

Quarterly Report to 31 December 2018

APPENDIX 1

JORC Code, 2012 Edition – Table 1 report template

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	<i>Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i>	<p>Gold Projects</p> <p>Rosemont The Rosemont gold deposit was sampled using Reverse Circulation (RC), HQ, NQ Diamond (DD) drill holes on a nominal 40m east by 40m north, or 20m east by 20m north grid spacing angled -48° to -81° towards 257° or 074° azimuth.</p> <p>Garden Well The Garden Well gold deposit was sampled using PQ and NQ Diamond drill (DD) holes on a nominal 20m east by 40m north grid spacing angled -55° to -60° towards 270° azimuth.</p> <p>Moolart Well, Tooheys Well, Baneygo/Idaho/McKenzies, Russells Find The gold projects above were sampled using Air Core (AC) or Reverse Circulation (RC) drill holes on various grid spacings angled -60° to -90° to varying azimuths designed to drill perpendicular to the strike of mineralisation.</p> <p>Discovery Ridge The Discovery Ridge gold deposit was sampled using PQ and HQ Diamond (DD) drill holes on a select pattern to infill larger data gaps, which were drilled angled -60° to -66° towards 240° azimuth.</p> <p>McPhillamys The McPhillamys gold deposit was sampled using HQ and PQ Diamond (DD) drill holes on a select pattern for geotechnical purposes, which were drilled angled -60° towards 078° azimuth.</p> <p>Other Regional Prospects (Crown, Moolart North, Swansons Nth, Ventnor, Winnebago, Petra SE) The Regional Prospects were sampled using Air Core (AC) drill holes or Reverse Circulation (RC) drill holes on various grid spacings angled -60° towards varying azimuths designed to drill as close as possible to perpendicular to the strike of mineralisation.</p> <p>Regional Prospects AC, RC Regis drill hole collar locations were picked up by handheld GPS. Hole azimuths were measured at the collar using a Suunto sighting compass.</p> <p>All Gold Projects AC, RC, DD</p>
	<i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i>	

Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.

Regis drill hole collar locations were picked up by an independent registered consulting surveyor or site-based authorised surveyors using Trimble RTK GPS. Downhole surveying was measured by using either a Reflex EZ-Shot Downhole Survey Instrument or North Seeking Gyro based tool where magnetic host rock would affect azimuth readings. The surveys were completed every 30m down each drill hole.

Diamond drill core is aligned and measured by tape, comparing back to down hole core blocks consistent with industry practice.

Regis drill hole sampling had certified standards and blanks inserted every 20th sample (DD only) or every 25th sample (RC and AC) to assess the accuracy and methodology of the external laboratories, and field duplicates (RC and AC only) were inserted every 20th sample to assess the repeatability and variability of the gold mineralisation. Laboratory duplicates were also completed approximately every 15th sample to assess the precision of the laboratory as well as the repeatability and variability of the gold mineralisation. Results of the QAQC sampling were considered acceptable.

All Gold Projects

For the Regis RC drilling, and AC drilling 1m samples were obtained by cone splitter (2.5kg – 3.0kg) and were utilised for lithology logging and assaying. The drilling samples were dried, crushed and pulverised to get 85% passing 75µm and were all Fire Assayed using a 50g charge.

All Gold Projects DD

Diamond drilling completed to industry standard using varying sample lengths (0.26 to 1.3m) based on geological intervals, which are then dried, crushed and pulverised to get 85% passing 75µm and were all Fire Assayed using a 50g charge (SGS West Wyalong, ALS – Orange, NSW; Bureau Veritas WA).

Other Regional Prospects AC

For AC drilling 1m spear samples were composited to 4m intervals. The drilling samples were dried, crushed and pulverised to get 85% passing 75µm and were analysed with an Aqua Regia Digest using a 10g charge. Anomalous results from 4m AC drill composites were spear sampled at 1m intervals. These drill samples were dried, crushed and pulverised to get 85% passing 75µm and were all Fire Assayed using a 50g charge.

Other Regional Prospects RC

For the Regis RC drilling 1m samples were obtained by cone splitter (2.5kg – 3.0kg) and were utilised for lithology logging and assaying. The drilling samples were dried, crushed and pulverised to get 85% passing 75µm and were all Fire Assayed using a 50g charge.

All Gold Projects/Prospects RC and AC drilling

RC drilling completed with a 139mm or 143mm diameter face sampling hammer. AC drilling was completed with an 89mm diameter AC blade bit.

Discovery Ridge, McPhillamys, Garden Well and Rosemont DD

Drilling techniques

Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).

Quarterly Report to 31 December 2018

		<p>Surface diamond drilling carried out by using NQ3, HQ3, or PQ3 (triple tube) and NQ, NQ2 or HQ2 (standard tube) techniques.</p> <p>Core is routinely orientated by REFLEX ACT III tool.</p>
<p>Drill sample recovery</p>	<p><i>Method of recording and assessing core and chip sample recoveries and results assessed.</i></p>	<p>All Gold Projects/Prospects RC and AC drilling</p> <p>RC and AC recovery was visually assessed, with recovery being excellent except in some wet intervals which are recorded on logs. 1% of the overall mineralised zones have been recorded as wet.</p> <p>Discovery Ridge, McPhillamys, Garden Well and Rosemont DD</p> <p>DD core was measured and compared to the drilled intervals, and recorded as a percentage recovery</p>
	<p><i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i></p>	<p>All Gold Projects/Prospects RC and AC drilling</p> <p>AC and RC samples were visually checked for recovery, moisture and contamination. The drilling contractor utilised a cone splitter to provide uniform sample size, and these were cleaned routinely (cleaned at the end of each rod and more frequently in wet conditions). A booster was also used in conjunction with the RC drill rig to ensure dry samples are achieved.</p> <p>Discovery Ridge, McPhillamys, Garden Well and Rosemont DD</p> <p>The target zones ranged from oxidised rock near surface where recoveries were lower to highly competent fresh rock, where the DD method provided high recovery.</p>
	<p><i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i></p>	<p>All Gold Projects/Prospects RC and AC drilling</p> <p>Sample recoveries for RC and AC drilling are visually estimated to be medium to high. No significant bias is expected although no recovery and grade correlation study was completed.</p> <p>Discovery Ridge, Garden Well and Rosemont DD</p> <p>The DD drill sample recovery in the transitional and fresh rock zones is very high, and no significant bias is expected. Recoveries in the oxidised rock were lower.</p>
<p>Logging</p>	<p><i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i></p>	<p>All Gold Projects/Prospects RC and AC drilling</p> <p>Lithology, alteration, veining, mineralisation and, on some holes, magnetic susceptibility were logged from the RC and AC chips and saved in the database. Chips from every interval are also placed in chip trays and stored in a designated building at site for future reference.</p> <p>Discovery Ridge, McPhillamys, Garden Well and Rosemont DD</p> <p>Lithology, alteration, veining, mineralisation and geotechnical information were logged from the DD core and saved in the database. Half cores from every interval are also retained in the core trays and stored in a designated building at site for future reference.</p>
	<p><i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i></p>	<p>All logging is qualitative except for magnetic susceptibility and geotechnical measurements. Wet and dry photographs were completed on the core.</p>

Quarterly Report to 31 December 2018

Sub-sampling techniques and sample preparation	<i>The total length and percentage of the relevant intersections logged.</i>	All drill holes are logged in full.
	<i>If core, whether cut or sawn and whether quarter, half or all core taken.</i>	Discovery Ridge, McPhillamys, Garden Well and Rosemont DD Core was half cut with an almonte diamond core saw with the same half always sampled and the surplus retained in the core trays.
	<i>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</i>	RC and AC drilling utilised a cyclone and cone splitter to consistently produce 0.5kg to 3.0kg dry samples.
	<i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i>	Samples are dried, crushed to 10mm, and then pulverised to 85% passing 75µm. This is considered acceptable.
	<i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i>	All Gold Projects AC & RC Field duplicates (RC, AC) were inserted every 20th sample to assess the repeatability and variability of the gold mineralisation. Laboratory duplicates were also completed roughly every 15th sample to assess the repeatability and variability of the gold mineralisation.
	<i>Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.</i>	Field duplicates (RC, AC) were taken at the rig from a second chute on the cone splitter allowing for the duplicate and main sample to be the same size and sampling technique. Field duplicates are taken every 20th sample. Laboratory duplicates (sample preparation split) were also completed roughly every 15th sample. Field duplicates on diamond core, i.e. other half of cut core, have not been routinely assayed.
	<i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i>	Sample sizes (1.0kg to 3kg) are considered to be a sufficient size to accurately represent the gold mineralisation based on the mineralisation style (hypogene associated with shearing, and supergene enrichment), the width and continuity of the intersections, the sampling methodology, the coarse gold variability and the assay ranges for the gold. Field duplicates have routinely been collected to ensure monitoring of the sub-sampling quality. Acceptable precision and accuracy are noted in the field duplicates albeit the precision is marginally acceptable and consistent with coarse gold deposits.

Quarterly Report to 31 December 2018

<p>Quality of assay data and laboratory tests</p>	<p><i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i></p> <p><i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i></p> <p><i>Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.</i></p>	<p>All Gold Projects AC & RC All gold assaying was completed by external commercial laboratories (SGS West Wyalong, ALS – Orange, NSW; Bureau Veritas, WA) using a 50g charge for fire assay analysis with AAS finish. This technique is industry standard for gold and considered appropriate.</p> <p>Discovery Ridge, McPhillamys, Garden Well and Rosemont DD All gold assaying was completed by commercial laboratories (SGS West Wyalong, ALS – Orange, NSW; Bureau Veritas, WA) using a 50g charge for fire assay analysis with AAS finish. This technique is industry standard for gold and considered appropriate.</p> <p>Other Regional Prospects RC/AC All gold assaying was completed by commercial laboratories (Intertek, WA) using a 10g charge for aqua regia digest for 4m composite AC samples. 1m RC samples and 1m AC re-samples are assayed by a commercial laboratory (Bureau Veritas, WA) using a 50g charge for fire assay analysis with AAS finish.</p> <p>Apart from magnetic susceptibility in targeted zones, no other geophysical measurements were routinely made.</p> <p>All Gold Projects AC & RC Certified Reference Material (CRM or standards) and blanks were inserted every 25th sample to assess the assaying accuracy of the external laboratories. Field duplicates (RC, AC) were inserted every 20th sample to assess the repeatability from the field and variability of the gold mineralisation. Laboratory duplicates were also completed approximately every 15th sample to assess the precision of assaying.</p> <p>Evaluation of both the Regis submitted standards, and the internal laboratory quality control data, indicates assaying to be accurate and without significant drift for significant time periods. Excluding obvious errors, the vast majority of the CRM assaying report shows no consistent positive or negative overall mean bias. Duplicate assays show high levels of correlation and no apparent bias between the duplicate pairs. Field duplicate samples show marginally acceptable levels of correlation and no relative bias.</p> <p>Results of the QAQC sampling were considered acceptable for the deposits. Substantial focus has been given to ensuring sampling procedures met industry best practise to ensure acceptable levels of accuracy and precision were achieved in a coarse gold environment.</p> <p>No independent personnel have visually inspected the significant intersections in RC chips. Numerous highly qualified and experienced company personnel from exploration and production positions have visually inspected the significant intersections in RC chips and diamond drill core.</p>
<p>Verification of sampling and assaying</p>	<p><i>The verification of significant intersections by either independent or alternative company personnel.</i></p>	

Quarterly Report to 31 December 2018

		Independent consultants (Entech) have inspected Rosemont Diamond drill core as part of due diligence for providing the maiden underground resource estimate.
	<i>The use of twinned holes.</i>	<p>No twinning of holes was completed in the current quarter.</p> <p>Several DD holes at Discovery Ridge are in proximity to historic holes but would not be classed as twin holes. Several DD holes were drilled at Rosemont in close proximity to RC holes. Several DD holes were drilled at Garden Well in close proximity to RC holes.</p>
	<i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i>	<p>In all cases gold grades and widths of mineralisation were considered comparable between drill sample types.</p> <p>All geological and field data is entered into Logchief commercial software, WA, or excel spreadsheets, NSW, with lookup tables and fixed formatting (and protected from modification) thus only allowing data to be entered using the Regis geological code system and sample protocol. Logchief data is validated and uploaded directly to the database. Excel spreadsheet data is emailed to the Regis database administrator for validation and importation into a SQL database using Datasched.</p>
	<i>Discuss any adjustment to assay data.</i>	For the purpose of resource estimation any samples not assayed (i.e. destroyed in processing, listed not received) have had the assay value converted to a -9 in the database. Any samples assayed below detection limit (0.01 ppm Au) have been converted to 0.005 ppm (half detection limit) in the database.
	<i>Location of data points</i>	<p>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</p> <p>All Gold Projects</p> <p>Regis drill hole collar locations were picked up by site-based authorized surveyors, or using Trimble RTK GPS, calibrated to a base station (expected accuracy of 20mm). For NSW Projects an independent licenced surveyor was used to pick up all drill collar locations using a Trimble RTK GPS.</p> <p>Downhole surveying was measured by using either a Reflex EZ-Shot Downhole Survey Instrument or North Seeking Gyro based tool where magnetic host rock would affect azimuth readings</p> <p>The surveys were completed every 30m down each drill hole.</p>
	<i>Specification of the grid system used.</i>	<p>WA Gold Projects</p> <p>The grid system is and AMG Zone 51 (AGD 84) for surveying pickups. Modelling at Rosemont and the Baneygo Area is completed using a local grid, with conversion of digital data from AMG to local completed using macros.</p> <p>NSW Gold Projects</p> <p>The grid system is and GDA94 Zone 55 for surveying pickups. Modelling at Discovery Ridge is completed using a local grid, with conversion of digital data from MGA94 to local completed using macros.</p>
	<i>Quality and adequacy of topographic control.</i>	The topographic surface for all projects were derived from a combination of the primary drill hole pickups and the pre-existing photogrammetric contouring.

Quarterly Report to 31 December 2018

<p><i>Data spacing and distribution</i></p>	<p><i>Data spacing for reporting of Exploration Results.</i></p>	<p>Moolart Well</p> <p>Current plan has reduced sample spacing to 25m x 25m in selected parts of the deposit.</p> <p>All other WA Gold Projects</p> <p>The drilling completed this period is planned reducing the effective spacing to 40 metres (east) by 40 metres north or 20 metres (east) by 20 metres (north).</p> <p>Discovery Ridge</p> <p>The drilling completed this period is planned reducing the effective spacing on the northern down plunge extension to 40 metres (east) by 20 metres (north).</p> <p>Regional Prospects</p> <p>Regional Prospects are generally drilled on a broad line spacing 320m to 160m with drill holes spacing from 80m to 20m depending on the style of mineralisation and width of target.</p>
	<p><i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i></p>	<p>The planned data spacing and distribution is sufficient to demonstrate spatial and grade continuity of the mineralised domains to support the definition of Inferred and Indicated Mineral Resources under the 2012 JORC code once all other modifying factors have been addressed.</p>
	<p><i>Whether sample compositing has been applied.</i></p>	<p>All Gold Projects</p> <p>No sample compositing has been applied in the field within the mineralised zones.</p> <p>Regional Prospects</p> <p>All first pass AC or RC drill samples were collected at 1m samples and composited to 4m intervals.</p>
<p><i>Orientation of data in relation to geological structure</i></p>	<p><i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i></p>	<p>Drilling on all projects is orientated to best suit the mineralisation to be closely perpendicular to both the strike and dip of the mineralisation. Intercepts are close to true-width in most cases. See cross section diagrams. In the case of Rosemont and Discovery Ridge drill programmes, the orientation mineralisation is sub vertical, as such the current drilling is designed to assist in refining ore geometry and therefore a more accurate estimate of true thickness. Drill orientation at Rosemont was adjusted as required to facilitate drilling around mine site infrastructure, and in some instances drill holes are at a high angle to the dip of mineralisation.</p>
	<p><i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i></p>	<p>It is not believed that drilling orientation has introduced a sampling bias.</p>

Quarterly Report to 31 December 2018

Sample security	<i>The measures taken to ensure sample security.</i>	<p>Samples are securely sealed and stored onsite, until delivery to Perth via contract freight Transport, who then deliver the samples directly to the laboratory. Sample submission forms are sent with the samples as well as emailed to the laboratory and are used to keep track of the sample batches.</p> <p>Discovery Ridge</p> <p>Samples are securely sealed and stored onsite, until pickup by SGS West Wyalong or ALS Orange truck and delivery to the laboratory. Sample submission forms are sent with the samples as well as emailed to the laboratory and are used to keep track of the sample batches.</p>
Audits or reviews	<i>The results of any audits or reviews of sampling techniques and data.</i>	No external audits on sampling techniques and data have been completed.

Quarterly Report to 31 December 2018

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Section 2 contains relevant data on projects and prospects discussed in the main body text of the December 2018 Quarterly Report, or those included in Appendix 2 and considered to be material.

Criteria	JORC Code explanation	Commentary
<i>Mineral tenement and land tenure status</i>	<p>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</p> <p>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</p>	<p>Rosemont The Rosemont project is located on M38/237, M38/250 & M38/343. Current registered holders of the tenements are Regis Resources Ltd & Duketon Resources Pty Ltd (100% subsidiary of Regis Resources Ltd). Area = 1683.2ha. Normal Western Australian state royalties apply plus there is a 2% Royalty to Franco Nevada. There are no registered Native Title Claims.</p> <p>Garden Well The Garden Well gold deposit is located on M38/1249, M38/1250, M38/283. Current registered holders of the tenements are: M38/1249 Regis Resources Ltd; M38/1250 and M38/283 Regis Resources Ltd and Duketon resources Pty Ltd (100% subsidiary of Regis Resources Ltd); 2% Royalty to Franco Nevada. Area = 2,739 ha. Normal Western Australian state royalties apply. There are no registered Native Title Claims.</p> <p>Moolart Well The Moolart Well Gold deposit is located on M38/498, M38/499, and M38/500. Current registered holders of the tenements are Regis Resources Ltd and Duketon Resources Pty Ltd (100% subsidiary of Regis Resources Ltd); Area = 2,267 ha. Normal Western Australian state royalties apply plus a 2% Royalty to Franco Nevada. There are no registered Native Title Claims.</p> <p>Baneygo/Idaho/McKenzies M38/344 – Reg Holders, Regis Resources Ltd & Duketon Resources Pty Ltd; Area 980.45ha; granted 23 April 1993; 2% Franco Nevada Royalty; no Native Title claims</p> <p>Tooheys Well The Tooheys Well prospect comprises M38/1251, an area of 9.109 km² (910.90 hectares). Normal Western Australian state royalties apply and a further 2% NSR royalty exists to a third party. Current registered holders of the tenements are Regis Resources Ltd and Duketon Resources Pty Ltd (100% subsidiary of Regis Resources). There are no registered Native Title Claims.</p> <p>Russells Find The Russells Find prospect is located on M38/114 and M38/630. Current registered holders are M38/114 – Regis Resources Ltd and Duketon Resources Pty Ltd (100% subsidiary of Regis Resources Ltd); 2% Royalty to Franco Nevada.</p>

M38/630 – Regis Resources Ltd and Duketon Resources Pty Ltd (100% subsidiary of Regis Resources Ltd); 2% Royalty to Franco Nevada. Normal Western Australian state royalties apply. There are no registered native title claims

Petra

The Petra prospect is located on M38/1247 and M38/1264. Current registered holders are M38/1247 – Regis Resources Ltd and Duketon Resources Pty Ltd (100% subsidiary of Regis Resources Ltd); 2% Royalty to Franco Nevada; M38/1264 - Regis Resources Ltd. Normal Western Australian state royalties apply. There are no registered native title claims.

Pleco/Crown

The Pleco/Crown gold prospects are located on M38/1249 and M38/1250. Current registered holders of the tenements are: M38/1249 Regis Resources Ltd, M38/1250 Regis Resources Ltd and Duketon resources Pty Ltd (100% subsidiary of Regis Resources Ltd); 2% Royalty to Franco Nevada. Normal Western Australian state royalties apply. There are no registered Native Title Claims.

Ventnor

The Ventnor Gold deposit is located on M38/302, M38/316 and M38/317. Current registered holders of the tenements are Regis Resources Ltd and Duketon Resources Pty Ltd (100% subsidiary of Regis Resources Ltd); Area = 2,086 ha. Normal Western Australian state royalties apply plus a 2% Royalty to Franco Nevada applies to M38/316 and M38/317. There are no registered Native Title Claims.

Discovery Ridge

NSW – EL5922 – Reg Holder, LFB Resources NL; granted 15 Feb 2002; transferred from Templar Resources Pty Ltd, 26 May 2017. There are no registered Native Title claims.

McPhillamys

The McPhillamys deposit is located on tenement EL5760 granted in 2000. Lease area = 11,760Ha. Current registered holder of the tenement is LFB Resources NL (100% subsidiary of Regis Resources). Normal NSW state royalties apply. There are no registered Native Title Claims.

Rosemont & Baneygo/Idaho/McKenzies

Shallow drilling (less than 100m vertical depth) completed by Aurora, Ashton and Johnsons Well Mining in the 1990's.

Moolart Well

Discovery drill holes by Normandy in early 2000s, Resource development drilling conducted by Newmont in early 2000s.

Garden Well/Tooheys Well

Minor amounts of drilling by Ashton and Johnsons Well Mining was completed although it was mainly shallow and not extensive enough to properly define the mineralisation.

Exploration
done by other
parties

Acknowledgment and appraisal of exploration by
other parties.

	<p>Russells Find Shallow drilling (less than 100m vertical depth) completed by Aurora, Ashton and Johnsons Well Mining. Mining activity was completed by Ashton in the 1990's.</p> <p>Petra Shallow drilling (less than 100m vertical depth) completed by Goldconda 1986 – 1988, Johnsons Well Mining NL 1995 – 1997.</p> <p>Pleco/Crown No historical drilling.</p> <p>Ventnor Shallow historical drilling (less than 100m vertical depth) completed by Ashton and Johnsons Well Mining in the 1990's.</p> <p>Discovery Ridge Resource development drilling conducted by Newmont and then Alkane Resources in the 1990's. Discovery Ridge previously drilled by Straits Resources and Goldminco.</p> <p>McPhillamys Resource development drilling conducted by Newmont and then Alkane Resources in the 1990's</p>
<p>Geology</p>	<p><i>Deposit type, geological setting and style of mineralisation.</i></p> <p>Rosemont & Baneygo/Idaho/McKenzies Gold is hosted in a steeply east dipping 345° trending quartz-dolerite unit intruding an ultramafic sequence. Gold mineralisation is associated with quartz-carbonate-chlorite-sulphide alteration and is restricted to the quartz dolerite unit which is generally approximately 80m wide. Weathering depths vary from 20m to 50m vertical depth.</p> <p>Garden Well & Pleco/Crown Gold is hosted in a moderate east dipping shear zone trending N-S. Gold mineralisation within ultramafic is associated with quartz, fuchsite, sericite, carbonate, sulphides. Gold mineralisation within chert, shale and BIF is associated with brecciated zones including elevated sulphides and quartz veins.</p> <p>Moolart Well Primary gold mineralisation at Moolart Well is associated with moderately east dipping N-S trending shear zones. The shear zones are closely related to diorite intrusives and rheology contrasts between units within the mine sequence of basalts/sediments, ultramafics, and dolerite sills.</p> <p>Tooheys Well</p>

The geology is similar to Garden Well with gold hosted in a moderately east dipping North-South trending chert and fine-grained sediment unit. Gold mineralisation is associated with magnetite replacement in BIF and disseminated sulphides in chert.

Russells Find

Gold mineralisation at Russell's Find is contained in steep east dipping quartz carbonate-biotite veins contained in a package of moderate east dipping carbonated ultramafic with a footwall sequence of chert, BIF and fine-grained silicified shale.

Petra

Gold mineralisation at Petra is hosted in NNW striking sheared intermediate volcanics. Gold mineralisation is associated quartz veins and sulphides, veins dip moderately west with elevated supergene gold mineralisation associated with regolith weathering horizons.

Ventnor

Gold mineralisation at Ventnor is associated with moderately east dipping N-S trending shear zones. The shear zones are closely related to diorite intrusives and rheology contrasts between units within greenstone sequence of basalts/sediments, ultramafics, and dolerite sills.

Discovery Ridge

Gold mineralisation at Discovery Ridge is subvertical - steeply plunging to the north and hosted in strongly foliated, fine-grained metasediments of the Ordovician Coombing and Adaminaby Formations.

McPhillamys

Gold mineralisation at McPhillamys steeply east dipping, hosted in strongly foliated Silurian intermediate volcanics.

Drill hole Information

A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:

easting and northing of the drill hole collar

elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar

dip and azimuth of the hole

down hole length and interception depth

hole length.

Refer to body of announcement and Appendix 2.

Quarterly Report to 31 December 2018

	<p><i>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</i></p>	
<p>Data aggregation methods</p>	<p><i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.</i></p> <p><i>Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</i></p> <p><i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i></p>	<p>Rosemont & Garden Well Reported intercepts include a minimum of 2.0 g/t Au value over a minimum distance of 0.1m with a maximum 2m consecutive internal waste. No upper cuts have been applied.</p> <p>Discovery Ridge & McPhillamys Reported intercepts include a minimum of 0.3 g/t Au value over a minimum distance of 0.1m with a maximum 6m consecutive internal waste. No upper cuts have been applied.</p> <p>All other Gold Projects and Prospects reported intercepts include a minimum of 0.5 g/t Au value over a minimum distance of 1m with a maximum 2m consecutive internal waste. No upper cuts have been applied.</p> <p>Appendix 2 All assay results above 1 g/t gold are reported.</p>
<p>Relationship between mineralisation widths and intercept lengths</p>	<p><i>These relationships are particularly important in the reporting of Exploration Results.</i></p> <p><i>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</i></p> <p><i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').</i></p>	<p>Rosemont, Baneygo/Idaho/McKenzies The Rosemont drill holes were nominally drilled at -48° to -80° toward 254° (or 074) and the mineralised zone is sub-vertical. Some intercepts reported are close to true width, steep angled holes are not true width where the mineralisation is sub vertical.</p> <p>Garden Well/Pleco/Crown/Tooheys Well/Russells Find The Garden Well drill holes were drilled at -50 ° to -60° towards 270° and the mineralised zone is moderately east dipping. The intercepts reported are close to true width. Some intercepts are not true width where the mineralisation is more steeply dipping (Russells Find).</p> <p>Moolart Well/Ventonor The Moolart Well drill holes were drilled at -50° to -90° towards 270° and the mineralized zone if moderately east dipping. The intercepts reported are close to true width.</p> <p>Petra Drill holes were orientated -60° towards 090° as the mineralised zone is moderately west dipping. The intercepts reported are close to true width.</p> <p>Discovery Ridge</p>

Quarterly Report to 31 December 2018

		<p>The mineralisation is thought to be near vertical and hence the intercepts reported can overstate true widths.</p> <p>McPhillamys The mineralisation is steeply east dipping and hence the intercepts reported can overstate true widths.</p>
<i>Diagrams</i>	<i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i>	Refer to the body of the announcement.
<i>Balanced reporting</i>	<i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i>	A list of all holes drilled during the quarter attached in Appendix 2 . All assay results above 1 g/t have been reported. Assay results below 1g/t are not considered material and are reported as such.
<i>Other substantive exploration data</i>	<i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i>	<p>Rosemont, Baneygo/Idaho/McKenzies, Garden Well, Moolart Well, Tooheys Well, Russells Find, Petra, Pleco, and Crown No other material exploration data to report.</p> <p>Discovery Ridge Discovery Ridge diamond holes were also utilised for bulk density measurements, and metallurgical test work. Geotechnical logging has been completed for determining ground conditions for open pit mining.</p> <p>McPhillamys McPhillamys diamond holes were also utilised for geotechnical test work determining ground conditions for open pit mining.</p>
<i>Further work</i>	<i>The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).</i>	Rosemont, Baneygo/Idaho/McKenzies, Garden Well, Moolart Well, and Pleco Infill and where appropriate, extensional drilling will continue in 2019.
	<i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i>	See diagrams in main text
