

## Inaugural drilling campaign delivers a 10% increase to the size of the mineral resource at Superior Lake

### Highlights

- JORC resource (2012) at Superior Lake Zinc Project increases by 10% to 2.35 Mt @ 17.7 % Zn, 0.9% Cu, 0.38 g/t Au and 34 g/t Ag (Table 1 below).
- The increase followed the Company's inaugural drilling campaign, the first at Superior Lake in over 20 years.
- 88% of the resource is classified in the Indicated category
- Average zinc grade remains at 17.7%
- The increased resource has potential to improve the Project economics and extend the mine life when the Definitive Feasibility Study is released by mid-2019.
- Exploration activities are ongoing at site with a high-powered ground Transient Electromagnetic program underway with results due in the coming weeks.

**Superior Lake Resources Limited (ASX: SUP)** (the "Company") is pleased to announce an increase in the Mineral Resource at the Superior Lake Project ("Superior Lake" or the "Project") to 2.35 Mt at 17.7 %Zn, 0.9% Cu. This represents an increase of approximately 10 % to the size of the resource compared to that previously reported on 3 July 2018. The additional resource has potential to increase the mine life when the Definitive Feasibility Study ("DFS") is completed by mid-2019.

In addition to the resource upgrade, a down the hole Transient Electromagnetics ("TEM") program at Pick Lake was completed. As Pick Lake is a known deposit, this was simply a "test case" to confirm EM as a successful exploration tool in detecting and defining similar mineralisation at the Project. The results were positive as Pick Lake was clearly identified. This has increased the Company's confidence that electromagnetics is the correct exploration technique to be used to identify new anomalies at Superior Lake. The Company is currently completing a high-powered ground TEM geophysics program across a 3km by 3km area, with results expected in the coming weeks.

The Assessment and Reporting Criteria in accordance with the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves' ("JORC Code 2012") is presented in Appendix 2.

**Table 1: Superior Lake Mineral Resource at 3% Zn cut-off grade**

Classification	Tonnage (Mt)	Zn%	Cu%	Au g/t	Ag g/t
Indicated	2.07	18.0	0.9	0.38	34
Inferred	0.28	16.2	1.0	0.31	37
<b>Total</b>	<b>2.35</b>	<b>17.7</b>	<b>0.9</b>	<b>0.38</b>	<b>34</b>

Superior Lake Chief Executive Officer David Woodall said:

The aim of the first drill program at Superior Lake in more than 20 years, was to confirm the continuity of mineralisation through Mid Pick as this area was previously outside of the JORC resource. This program was successful as the drill results were in line with expectations, and led to the resource at Superior Lake increasing by 10% to 2.35 Mt @ 17.7 % Zn, 0.9% Cu, 0.38 g/t Au and 34 g/t Ag.

The additional 200,000 tonnes should further optimise the Project's economics in the upcoming DFS, as Mid Pick was previously not included in the mine plan. However, this area was adjacent to the planned Pick decline and therefore should be easily accessed without the requirement for changes to mine development, resulting in improved economics whilst also increasing the mine life. The Restart Study assumed a throughput of 1,000tpd<sup>1</sup>, which we expect will remain unchanged.

In addition to the resource upgrade, a DHTEM program was undertaken at Pick Lake. Typically this technique is used to identify anomalies to be tested with drilling in the future. In this case however, the Company used DHTEM on Pick Lake, a known mineralised deposit essentially as a test case, to determine if electromagnetics could identify the deposit. Pleasingly the results came back positive as Pick Lake was clearly identified. This has significantly increased our confidence that EM will not only be a major part of but essential to our exploration strategy going forward to identify new potential targets.

We are now currently completing a high-powered ground TEM geophysics program across the Project area and we look forward to updating the market on these results in the coming weeks.

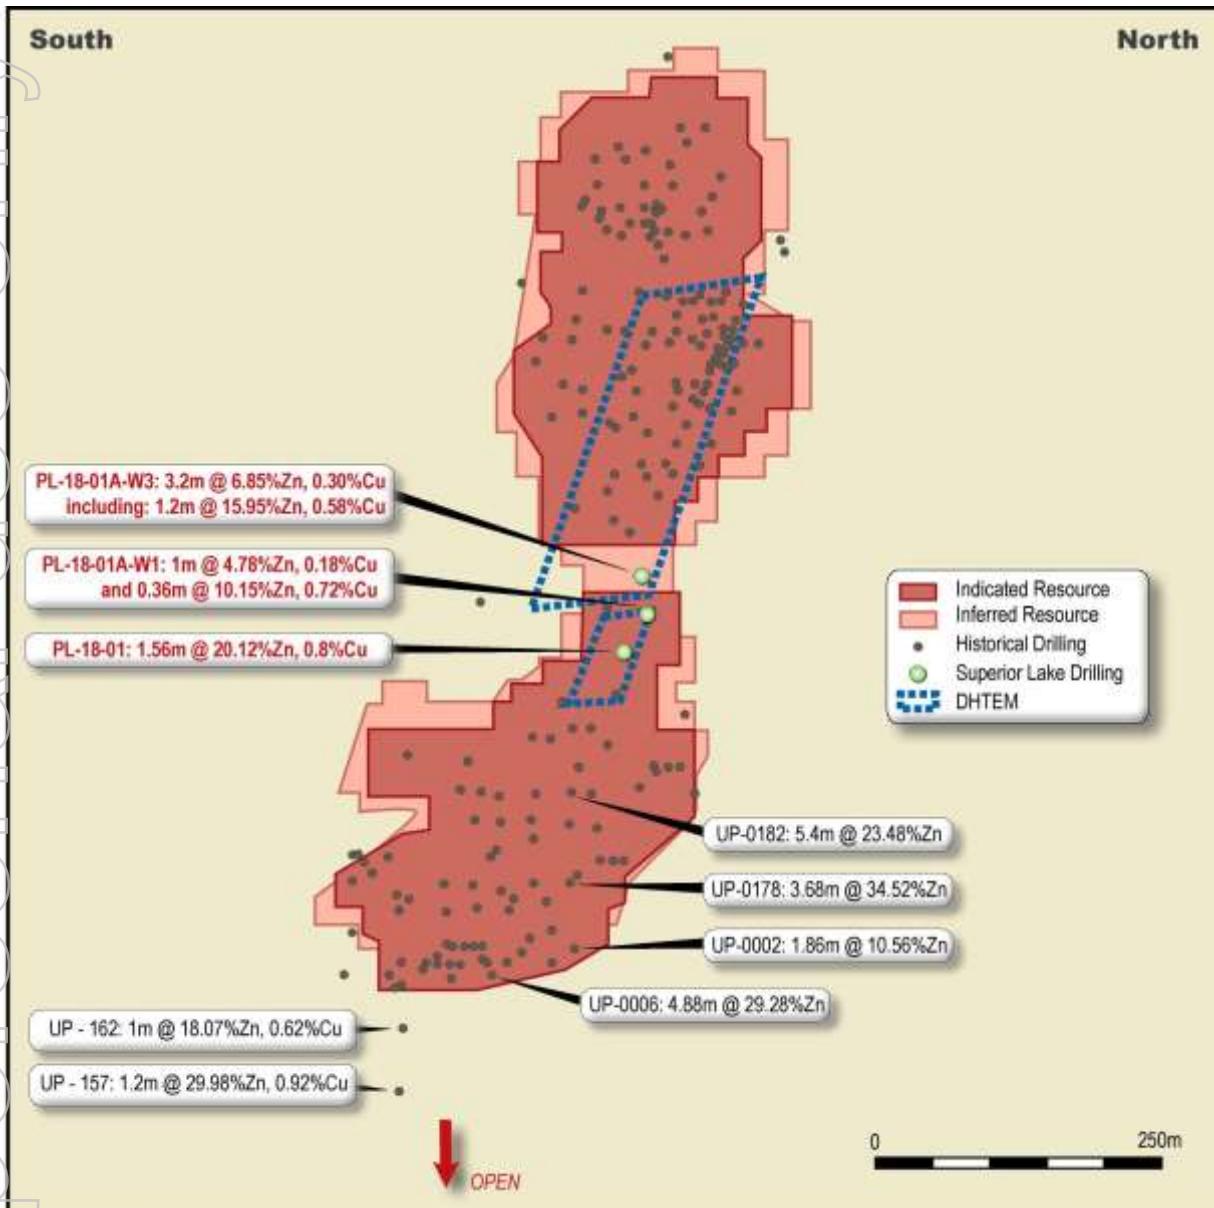

Finally, as we continue to advance the Project towards a development decision later this year, numerous major global financial institutions, private equity firms and potential offtake partners are showing strong interest in the Project. The Company plans to commence a competitive project finance process in the near term."

---

<sup>1</sup> See ASX announcement "Outstanding study confirms Superior Lake as low-cost project" dated 10 October 2018. The Company confirms that it is not aware of any new information or data that materially affects the information in that announcement (save for the inclusion of the additional 200,000 tonnes), and that all material assumptions and technical parameters underpinning the production targets and forecast financial information based on production targets in that announcement continue to apply and have not materially changed. As stated above, the inclusion of the 200,000 tonnes will not materially affect the throughput set out in the Restart Study.

Figure 1: Long Section – Pick Lake<sup>2</sup>

### Resource upgrade – Pick Lake Deposit

The Superior Lake Zinc Project is located around 200 kilometers east of Thunder Bay in the province of Ontario in Canada. The Project covers an area of 175km<sup>2</sup> and consists of two deposits – Winston Lake and Pick Lake.

A Restart Study completed in October 2018, outlined an operation at Superior Lake that would produce 46,000tpa of contained zinc metal with All in Sustaining Operating Costs ("AISC") of US\$0.51 / lb (see Footnote 1, page 2). The Company is currently working towards the release of a DFS in mid-2019, with the Pick Lake deposit expected to provide the majority of ore for the operation.

<sup>2</sup>The exploration results from drill holes UP-0182, UP-0178, UP-002 and UP-006 were previously reported in an ASX announcement dated 3 July 2018. The Company confirms that it is not aware of any new information or data that materially affects the information in that announcement.

Pick Lake is a high-grade zinc deposit that extends over a downdip distance of 1,200m. The deposit has historically been defined in three sub areas – Upper Pick, Mid Pick and Lower Pick. Whilst the Upper and Lower Pick areas have been intensively drilled from underground, Mid-Pick required additional drilling to define a defined resource.

The Company therefore completed a 1,750m drilling program to confirm the continuity and grade at Mid Pick, compared to other areas of the deposit. This was the first drill program at the Project in more than 20 years.

Image 2: Drilling at Pick Lake

The results from the program were in line with expectations as it confirmed high-grade zinc mineralisation through the Mid Pick area. Intersections included<sup>3</sup> the following.

- PL-18-01                    1.56m @ 20.12% Zn and 0.80% Cu
- PL-18-01A-W1              1.0m @ 4.78% Zn and 0.18% Cu
- PL-18-01A-W2              dislodged wedge resulting in lost hole
- PL-18-01A-W3              3.7m @ 5.95% Zn and 0.28% Cu, inclusive of 1.0m 15.95% Zn and 0.58% Cu

The increase in the Superior Lake resource represented 10% of its Exploration Target, which, given the relatively small scale of this inaugural drilling program is encouraging. The Exploration Target is conceptual in nature. Other than as reported, there has been insufficient

<sup>3</sup> Drill hole information is available in Appendix 1.

exploration to estimate a Mineral Resource and it is uncertain if further exploration will result in the estimation of a Mineral Resource.<sup>4</sup>

The Superior Lake resource estimate, as at 6<sup>th</sup> March 2019, is shown in Table 2 is classified in accordance with Canadian Institute of Mining, Metallurgy and Petroleum and JORC 2012.

<sup>4</sup> See ASX announcement "Significant brownfields exploration target at Superior Lake" dated 26 September 2018. The initial brownfields exploration Target was determined to be between 2.1 to 5.2 million tonnes at a grade ranging between 13.3% to 15.4% Zn for its Superior Lake Project. The Company confirms that it is not aware of any new information or data that materially affects the information in that announcement. The Exploration Target is based on the current geological understanding of the mineralised geometry, subsurface geochemistry provided an extensive historic drill hole database and detailed underground mapping provided by historic mining activity coupled with understanding of the host stratigraphic sequence. The Company intends to test the Exploration Target, based on the outcomes of further geophysical surveys and, potentially with drilling. These activities are expected to extend over approximately 18 months from 26 September 2018. The Exploration Target is based largely on extensions of the reported classified resource into areas that have not been drill-tested in the past. These areas cover the strike and plunge continuations of the defined classified resources within host rocks that are the same as those that host the resources. Grade ranges have been either estimated or assigned from the classified resource using either a 3% Zn cut off for the lower bound grade and 6% Zn cut off for the upper bound grade. A classification is not applicable for an Exploration Target.

## Mineral Resource Description and Methodology

The Superior Lake Zinc Project consists of two deposits, Pick Lake and Winston Lake, and is located approximately 200 kilometres east of the city of Thunder Bay Ontario, Canada. This is the highest-grade zinc project in Canada. The Project was mined for a decade (3Mt of ore mined) before closing in 1999, due to a sustained period of a low zinc price.

### Geology and Geological Interpretation

Winston Lake and Pick Lake are recognised as Noranda-style VMS deposits which are characterised by the presence of the zinc-copper (+/- gold, +/- galena, +/- tetrahedrite) mineralisation composed of sphalerite-chalcopyrite-pyrrhotite-pyrite which can be surrounded by pyrite-pyrrhotite halo with minor sphalerite, tetrahedrite and galena. Confidence in the model is high as the mineralisation of the deposits essentially occurred as a single massive sulphide seam distributed along the VMS horizon. The mineralisation and the host rock stratigraphy can be delineated between the drill holes.

Geological interpretation and the updated resource model are based on the drill holes data completed during the mid-Pick drilling program and historical drilling (approximately 1787 drill holes) as well as digitised underground drive maps and cross sections. The interpretation of the mineralisation was confirmed by drilling between the Upper and Lower Pick resources and DTEM that proved the continuity and the grade of the mid-Pick Resource.

### Sampling and Sub-Sampling Techniques

The mineralisation was defined by intervals logged as massive and semi-massive sulphides within the Pick clotted rhyolite or tuff units and within Winston the rhyolites, tuffs and chert units. The assay values for zinc were compared to these intervals and found to correlate well. The zinc percent assay values were used to select intersections where no logging information was present. The interpretation of continuity was based on ore drive level plans that showed mapping information for the sulphide horizon.

A nominal cut-off grade of 1% Zn was used to define the mineralised intervals which were used to construct a vein model. Edge boundaries were applied from ore drive extents and long-section mine plans that indicated the conductor boundary position from geophysical surveys.

Data from these logs were entered into an Excel spreadsheet, subjected to QAQC and manual error correction and then uploaded into an Access database. Subsequent loading errors in 3D mining software were then corrected. The consistency of the assay data from the very high density of historic sampling suggests that industry-standard QAQC procedures were adopted at the time. The dataset is considered to be acceptable for use in Mineral Resource estimation by the Competent Person.

### Drilling Techniques

Diamond drillholes were used to sample the mineralisation at Pick and Winston was based on 1603 holes drill from both underground and surface. Detailed drill logs were recovered from archives in Schrieber, Ontario. The distances between drillholes intersecting the mineralisation are commonly from 10–30m (at the Winston Lake deposit to 20–40m at the Pick Lake deposit which is sufficient for a confident delineation of the mineralised bodies. The interpretation of the VMS bodies was confirmed by mapping and sampling of the underground developments which are also used for constraining VMS mineralised bodies in 3D.

### Sample Analysis Method

Samples were composited to 1m lengths using a best fit algorithm. Statistical continuity analysis of the samples was carried out using Istatis® geostatistical software to produce variograms for each element. The block models were constructed using parent cell sizes of 20mE by 20mN by 1mRL with sub-cell sizes of 0.5mE by 0.5mN by 0.5mRL for Pick and 1mE by 1mN by 1mRL for Winston. The composite data was unflattened

and two pass estimation of grades was carried out in unfolded space using Ordinary Kriging or Simple Kriging.

## Criteria Used for Classification and Estimation Methodology

The mineralised domains have demonstrated sufficient confidence in both geological and grade continuity to support the definition of Mineral Resources. The nominal drill spacing of 20 to 30m, together with geological mapping and sampling from ore development, alimak raises and stoping is considered to be sufficient to assign an Indicated Mineral Resource classification to the majority of the Mineral Resource. Material classified as Inferred Mineral Resources is located on the margins of the Indicated Mineral Resources and the extents of the mineralisation, where sampling and control on the domain geometry are less confident. The input data is comprehensive in its coverage of the deposits and does not favour or misrepresent the in-situ mineralisation. Refer to the sub-heading "Estimation and modelling techniques" in Section 3 of Table 1 Reporting for the use of extrapolation.

## Discussion of Modifying Factors

Superior Lake is progressing with the longhole mining method with pastefill that is expected to be included in the DFS. Metallurgical testwork is currently being undertaken to quantify recoveries of zinc, copper and precious metals from Superior Lake. Pursuant to the DFS, the preparation of which is currently under way, work in relation to other modifying factors is being carried out and will be reported in the DFS.

## About the Company

Superior Lake Resources Limited is focused on the redevelopment of the Superior Lake Project in North Western Ontario, Canada. The Project contains a JORC resource of 2.35 Mt at 17.7 % Zn, 0.9 % Cu, 0.38 g/t Au and 34g/t Ag. A Restart Study completed in 2018, forecast the Project to produce approximately 46,000tpa Zn, with forecasted AISC of US\$0.51 / lb (see Footnote 1, page 2. The Company is currently working towards the release of a DFS, which is expected by mid-2019.

## Competent Person Statement

### Exploration Results

The information contained in this announcement that relates to the exploration target and exploration results is based on, and fairly reflects, information compiled by Mr. Alfred Gillman, an independent consultant to Superior Lake Resources Limited, employed by Odessa Resources. Mr. Alfred Gillman is a Fellow and Chartered Professional of the Australian Institute of Mining and Metallurgy and was engaged as a consultant to Superior Lake in relation to the JORC (2012) resource. Mr. Gillman has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr. Gillman consents to the inclusion in this announcement of the matters based on his information in the form and context in which it appears.

### Mineral Resources

The information contained in this announcement that relates to the exploration results and mineral resource estimates is based on, and fairly reflects, information compiled by Dr Marat Abzalov, an independent consultant for MASSA Geoservices. Dr Marat Abzalov is a Fellow of the Australian Institute of Mining and Metallurgy and was engaged as a consultant to Superior Lake Resources to complete the JORC (2012) resource. Dr Abzalov has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code of Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Dr Abzalov consents to the inclusion in this announcement of the matters based on his information in the form and context in which it appears. Dr Abzalov holds securities in Superior Lake Resources Limited.

	<i>The total length and percentage of the relevant intersections logged.</i>	100% of the core has been geologically logged.																		
<b>Sub-sampling techniques and sample preparation</b>	<i>If core, whether cut or sawn and whether quarter, half or all core taken.</i>	<p>Sub-sampling protocols of the historic data are not available.</p> <p>Recent analysis of the duplicate samples has confirmed a good repeatability of the historic assays, confirming that historic data are lacking of biases (Fig.A1.3)</p> <p>Good repeatability of the historic data expressed as insignificant scatter of the data points around the first bisect (1:1 line) on the diagram (Fig.A1.3) confirms that sub-sampling protocols were appropriate for this style of mineralisation.</p>																		
	<i>If non-core, whether riffled, tube sampled, rotary split, etc and whether</i>	All sampling was carried with diamond core																		

Criteria	Explanation	Commentary
	<i>sampled wet or dry.</i>	
	<i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i>	All sample preparation, related to the historic data, was made in the two external laboratories: Swastika Laboratories (Swastika, Ontario) and Metric Lab (Thunder Bay, Ontario) that have followed standard procedures of the Canadian mining industry standards developed for the base metal mineralisation.
	<i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i>	<ul style="list-style-type: none"> <li>The archive data does not contain QAQC information, however, the good consistency of the assay data of historic sampling suggests that standard QAQC procedures were adopted in the past assuring quality of the samples.</li> <li>Standard quality control procedures used by the Canadian analytical laboratories includes assessment of quality of the comminution. This is made by test screening of the selected samples and estimating the percentage of material passed through the screen assuring that this is matching to the established protocol.</li> </ul> <p>These procedures were used during the recent drilling by Superior Lake and it is assumed that similar procedures were used through the course of the Project. Good repeatability of the historic data expressed as insignificant scatter of the data points around the first bisect (1:1 line) on the diagram (Fig.A1.3) confirms that sub-sampling protocols were appropriate for this style of mineralisation.</p>
	<i>Measures taken to ensure that the sampling is representative of the in-situ material collected, including for</i>	<ul style="list-style-type: none"> <li>The use of diamond core drillholes is considered to provide representative samples of the in-situ mineralisation, particularly the true thickness (sampling was done to geological boundaries).</li> </ul> <p>Significant part of the samples was collected using underground drilling that provides optimal intersections with mineralisation, commonly close to 90°</p>

Criteria	Explanation	Commentary
	<i>instance results for field duplicate/second-half sampling.</i>	
<b>Quality of assay data and laboratory tests</b>	<i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i>	<p>Two external laboratories used historically: Swastika Laboratories (Swastika, Ontario) and Metric Lab (Thunder Bay, Ontario).</p> <p>It is assumed that the quality of assays is compliant with the standards of Canadian industry at the time when Pick Lake and Winston Lake deposits were explored and mined. Appropriateness of the assaying and laboratory procedures that was historically used can be inferred from the fact of successful mining of these deposits and no reconciliation issues were identified in the archive documentation. Good repeatability of the historic data expressed as insignificant scatter of the data points around the first bisect (1:1 line) on the diagram (Fig.A1.3) confirms that sub-sampling protocols were appropriate for this style of mineralisation. A total of 64 samples were used which is representative.</p>
	<i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied</i>	<p>Down-hole EM (DHEM) survey has been undertaken by Superior Lake in 2019 that has confirmed continuity of the Zn-Cu mineralisation between Upper and Lower Pick domains (Fig. A1.2).</p> <p>The survey details are as follows:</p> <p>Digital receiver: DigiAtlantis, s/n 130      Tx synchronization: GPS      Integration time: 4 cycles of 128 stacks      Start of integration: 90 µs from end of turn off      Number of gates: 36, geometrically spaced      Additional delay: 0 µs      Power line filter: 60 Hz</p> <p>Transmitter: TerraScope, PRO5U, s/n 8NF      Power supply: Voltmaster 13000 long run generator</p>

Criteria	Explanation <i>and their derivation, etc.</i>	Commentary
		<p>Maximal output: 18 kW or 38 A or 400 V</p> <p>Transmitted signal: bipolar wave, 50% duty cycle</p> <p>Repetition rate: 1 Hz (<math>T/4 = 250</math> ms)</p> <p>The DigiAtlantis probe was synchronized with the TerraScope transmitter using a EMIT Transmitter Controller with GPS timing.</p> <p>The transmitter energized a loop measuring roughly 1200m x 1500m.</p> <p>Readings taken at 10m intervals down-hole from 30m to EOH.</p> <p>Data were modelled using the program Maxwell distributed by Electromagnetic Imaging Technology which implements a variant of the current ribbon approximation for the EM response of a plate-like conductor devised by Lamontagne et al (1998).</p> <p>Lamontagne, Y., Macnae, J., Polzer, B., 1998. Multiple conductor modelling using program Multiloop. 58th Ann. Mtg. of Soc. Exploration Geophysics, Expanded Abstracts.</p>

Criteria	Explanation	Commentary
		 <p>Fig. A1.2: The conductive plates (blue polygons) which have been identified by the DHEM survey undertaken by Superior Lake Resources with an aim to confirm continuity of VMS mineralisation between Upper Pick and Lower Pick domains</p>
	<i>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels</i>	<ul style="list-style-type: none"> <li>The archive data does not contain QAQC information, however, the good consistency of the assay data of historic sampling suggests that standard QAQC procedures were adopted in the past assuring quality of the samples.</li> <li>Recent analysis of the duplicate samples has confirmed a good repeatability of the historic assays, confirming that historic data are lacking of biases (Fig.A1.3)</li> <li>Good repeatability of the historic data expressed as insignificant scatter of the data points around the first bisect (1:1 line) on the diagram (Fig.A1.3) confirms that sub-sampling protocols were appropriate for this style of mineralisation.</li> </ul>

Criteria	Explanation	Commentary
	<p><i>of accuracy (ie lack of bias) and precision have been established.</i></p>	 <p>Zn% (historic)</p> <p>Zn% (duplicate) ALS Canada</p> <p>Mean (duplicate) = 12.1 % Mean (historic) = 11.7 % Correlation = 0.99 CV% = 20 Prma% (1SD) = 9.5</p>
<b>Verification of sampling and assaying</b>	<p><i>The verification of significant intersections by either independent or alternative company personnel.</i></p>	<p>Superior Lake submitted 64 drill core samples from historic drilling to ALS Canada Ltd Laboratories (preparation done at Thunder Bay, analysis done in Vancouver) as an independent check in June 2018. Samples were quarter core, crushed to 70% passing 2mm, and pulverised to 85% passing &lt;75um. Analysis for Zn and Cu were carried out using Inductively Coupled Plasma- Atomic Emission Spectroscopy (ICP-AES), Au by 30gram Fire Assay with an Atomic Absorption Spectroscopy finish, Ag was by Aqua Regia with an AAS finish.</p>

	<i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i>	During the past exploration campaigns, the drillholes has been logged into the paper forms which have been obtained by Superior Lake resources and digitised in to the database. Initially data from these logs were entered into an Excel spreadsheet, subjected to QAQC and manual error correction and then uploaded into an Access database. Subsequent loading errors in 3D mining software were then corrected. The dataset is considered to be acceptable for use in Mineral Resource estimation by the Competent Person.																																																																																																																																																																																				
	<i>Discuss any adjustment to assay data.</i>	No adjustment to assay data has been made.																																																																																																																																																																																				

Criteria	Explanation	Commentary
<b>Location of data points</b>	<i>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i>	<ul style="list-style-type: none"> <li>The method for surveying historical surface drillhole collars is not known but it is assumed that the Mine Surveyors were responsible for the underground drilling. The downhole survey methods used are Eastman single shot and multishot, Tropari, acid etch and gyro survey at nominal 30m intervals. Superior Lake is in the process of compiling all hard copy drillhole data.</li> </ul> <p>Drillhole locations have been validated against mine workings and plans.</p>
	<i>Specification of the grid system used</i>	<ul style="list-style-type: none"> <li>Historical mining and exploration activities were carried out in local mine grids. The Winston local mine grid is oriented approximately -20 degrees to UTM grid north and the Pick local mine is oriented at -60 degrees to UTM grid north.</li> </ul> <p>The information had been transformed from local grid co-ordinates into UTM NAD83 Zone 16 grid via a two-point transformation.</p>
	<i>Quality and adequacy of topographic control</i>	A topographic surface was generated from SRTM data and has had the surface drill collar location points added in to provide local control.
<b>Data spacing and distribution</b>	<i>Data spacing for reporting of Exploration Results.</i>	<ul style="list-style-type: none"> <li>Pick Lake has been drilled from surface approximately at 100 - 200m centres.</li> </ul> <p>Underground drilling at both Pick Lake and Winston Lake has been drilled on a much tighter grid, approximately at 40m centres at the Pick Lake and 20m at the Winston Lake, and down to less than 10m in places.</p>

Criteria	Explanation	Commentary
	<p><i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i></p>	<ul style="list-style-type: none"> <li>Drillholes spacing, which are distributed approximately as a random stratified grids of 40x40m at the Pick Lake and 20x20m at the Winston Lake allow to accurately establish continuity of mineralisation and estimate the grade distribution. These grids are appropriate for Mineral Resource estimation.</li> </ul> <p>The production history and information available from the mining operations forms part of the confidence criteria used to classify the Mineral Resource.</p>
	<p><i>Whether sample compositing has been applied.</i></p>	<ul style="list-style-type: none"> <li>Samples have been taken based on geological intervals, with a nominal maximum length of 1 metre.</li> </ul> <p>Physical compositing of the samples not used</p>
<p><b>Orientation of data in relation to geological structure</b></p>	<p><i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to</i></p>	<ul style="list-style-type: none"> <li>Based on 3D model reviewed the intersection angles in general are close to perpendicular and appropriate for Resource estimation. Some of the drillhole have low intersection angles due to the location of the drill sites, but these are still considered to be representative.</li> <li>The new drillholes, drilled by Superior Lake Resources in 2019 have been completed using wedging equipment allowing to orientate drillholes in order to obtain an optimal intersection with the drill target. Location of the drilled hole was surveyed every day after, approximately 50 m of advancing and this has allowed to closely monitor deviations of the drillholes and correct it using the wedges.</li> </ul>

Criteria	Explanation	Commentary
	<i>which this is known, considering the deposit type.</i>	<ul style="list-style-type: none"> <li>Downhole surveying was made using Gyro camera, which is optimal for surveying in the rocks, containing ferro-magnetic minerals</li> </ul>
	<i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i>	<ul style="list-style-type: none"> <li>As drillholes were generally drilled perpendicular to the strike of mineralisation, there has not been any sampling bias introduced based on the current understanding of the structural orientations and the dip and strike of mineralisation.</li> </ul>
<b>Sample Security</b>	<i>The measures taken to ensure sample security.</i>	As was standard practice on the mining projects and the operating mines, it is assumed that Inmet Mining organised delivery of samples directly to assay laboratories and other previous explorers followed industry guidelines current at the time.
<b>Audits or reviews</b>	<i>The results of any audits or reviews of sampling techniques and data.</i>	<p>2013. Rémi Verschelden validated the analytical data of the grab samples using the values in the ALS Chemex and SGS Canada certificates of analysis. The validation consisted of verifying all grab sample results for Au, Cu, and Zn as reported by Silvore Fox in 2012 from the property. No errors were noted during the validation.</p> <p>2019. Superior Lake has reviewed and validated historic data, that included re-assaying of mineralised intervals. In total, 64 samples have been collected and assayed that confirm validity of the historic data</p>

Criteria	Explanation	Commentary
		During data verification, no indication was found of anything in the exploration work, or analytical data that could have negatively affected the reliability of the assay results reported.

## Section 2 Reporting of Exploration Results

Criteria	Explanation	Commentary
<b><i>Mineral tenement and land tenure status</i></b>	<i>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</i>	<p>The Pick Lake Project comprises 297 claim units (each claim unit is 400mx400m or 16Ha in area) totalling 47.5km<sup>2</sup>. The claims are made up of a number of claims acquired in August 2016 and claims recently staked and registered in October 2017. The total of all claim areas is &gt;17,000Ha.</p> <p>Superior is the legal and beneficial owner of 70% of the issue capital of Ophiolite Holdings Pty Ltd (ACN 617 182 966) (Ophiolite). Ophiolite is a proprietary exploration company and is the legal and beneficial owner of the zinc and copper prospective “Pick Lake Project”, located in Ontario. Please see ASX announcement dated 6 December 2017.</p> <p>Superior Lake currently has an option over the Winston Lake project claims. These claims are owned by FQM. For further details please refer to ASX announcement dated 21<sup>st</sup> February 2018.</p>
	<i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i>	The claims are in good standing.

Criteria	Explanation	Commentary																											
<b>Exploration done by other parties</b>	<i>Acknowledgment and appraisal of exploration by other parties.</i>	<p>The Pick Lake deposit was discovered in 1983 and the Winston Lake deposit was discovered in 1982. The Pick Lake and Winston Lake project areas have been the subject of a variety of exploration campaigns, main exploration and development stages are listed in the table:</p> <table border="1" data-bbox="878 419 1563 874"> <thead> <tr> <th data-bbox="878 419 1012 462">Year</th><th data-bbox="1012 419 1147 462">Company</th><th data-bbox="1147 419 1563 462">Results</th></tr> </thead> <tbody> <tr> <td data-bbox="878 462 1012 520">1951-1952</td><td data-bbox="1012 462 1147 520"><u>Ciglen;Anderson; Andowan Min.</u></td><td data-bbox="1147 462 1563 520">Discovery of Anderson occurrence</td></tr> <tr> <td data-bbox="878 520 1012 579">1978-1986</td><td data-bbox="1012 520 1147 579">Falconbridge</td><td data-bbox="1147 520 1563 579">Discovery of Trail occurrence Discovery of Winston Lake deposit Discovery of Pick Lake deposit</td></tr> <tr> <td data-bbox="878 579 1012 638">1983-1984</td><td data-bbox="1012 579 1147 638">Noranda Expl.</td><td data-bbox="1147 579 1563 638">Several geophysical anomalies</td></tr> <tr> <td data-bbox="878 638 1012 747">1987-1992</td><td data-bbox="1012 638 1147 747"><u>Minnova Inc.</u></td><td data-bbox="1147 638 1563 747">High grade mineralisation discovered at Pick Lake DDH67: 13.4@25%Zn/ 2.7%Cu</td></tr> <tr> <td data-bbox="878 747 1012 790">1995-1998</td><td data-bbox="1012 747 1147 790"><u>Inmet Mining</u></td><td data-bbox="1147 747 1563 790">Production at the Pick Lake</td></tr> <tr> <td data-bbox="878 790 1012 833">2008-2010</td><td data-bbox="1012 790 1147 833"><u>Orebot Inc.</u></td><td data-bbox="1147 790 1563 833">New geochem. anomalies</td></tr> <tr> <td data-bbox="878 833 1012 860">2011-2013</td><td data-bbox="1012 833 1147 860">Silver F./Gold. <b>Geology</b>	<i>Deposit type, geological setting and style of mineralisation</i>	<b>Pick Lake</b> <p>The Pick Lake deposit and all nearby prospects are examples of metamorphosed volcanogenic massive sulphide (VMS) deposits, that form in collisional oceanic tectonic environments in areas of localized rifting. The Pick Lake deposit belongs to the bimodal mafic volcanic sub-type, also known as Canadian-shield or Noranda-type VMS deposits. The deposits of this sub-type are characterised by dominating of the mafic volcanics with the felsic volcanic rocks constituting less than 25% of the sequence. A significant</p>																											

Criteria	Explanation	Commentary
		<p>characteristic of this deposit type is the tendency of the deposits to occur in clusters or “camps” either along a single stratigraphic horizon or stacked within the volcanic sequence. The deposits tend to form stratiform massive sulphide lenses with or without discordant feeder pipes cutting across the underlying stratigraphy. The massive sulphide lens may be displaced from the feeder pipe, which represents the hydrothermal vent onto the ancient sea floor.</p> <p>The Pick Lake deposit occurs at the extreme western edge of the Winston-Big Duck Lake sequence of volcanic rocks, approximately 35 metres above a granitic contact. Aeromagnetics within the Project area depicts a distinctive V shaped sequence of magnetic and non-magnetic units converging to a northern “V” apex and appears remarkably similar to the aeromagnetic character of the older Archean Warriedar Fold Belt in Western Australia which hosts the Golden Grove VMS deposits.</p> <p>The Pick Lake deposit occurs as a large sheet like zone of massive sulphides within a series of bedded pyroclastic rocks. Hydrothermal alteration exists in both footwall and hangingwall rocks resulting in varying assemblages of quartz, cordierite, biotite, anthophyllite, garnet, chlorite and sericite with minor disseminated sulphides. The hydrothermal alteration zone appears to be spatially related to the Winston Lake deposit; recent structural mapping provides evidence that Pick Lake and Winston Lake can be hosted within the same stratigraphic horizon.</p> <p>The Anderson showing, located near the southeast shore of Winston Lake, appears to be the surface expression of the Pick Lake deposit. This is a rusty pyritic weakly altered series of bimodal volcanics. Massive sulphides of the Pick Lake deposit occur from approximately 300m to 1200m vertically and over a strike length averaging 250 metres. The lower portion of the deposit appears to increase in strike length to approximately 500 metres. The deposit strikes at 20 degrees and dips to the east at 50 degrees. The thickness of the deposit is generally between 2 and 4m, however, locally it is up to 14 metres.</p> <p>Sulphide mineralisation is generally very consistent, composed of a fine-grained mixture of sphalerite (50-80%) and pyrrhotite (5-35%) with minor chalcopyrite (0-5%) and pyrite (0-3%). Commonly contained within the sulphides is 5-10% of quartz inclusions, that are represented by the rounded grains up to 3cm in size (Fig. A2.1a) and, less commonly, by veins, cutting the massive sulphide mineralisation (Fig.A2.1b).</p>

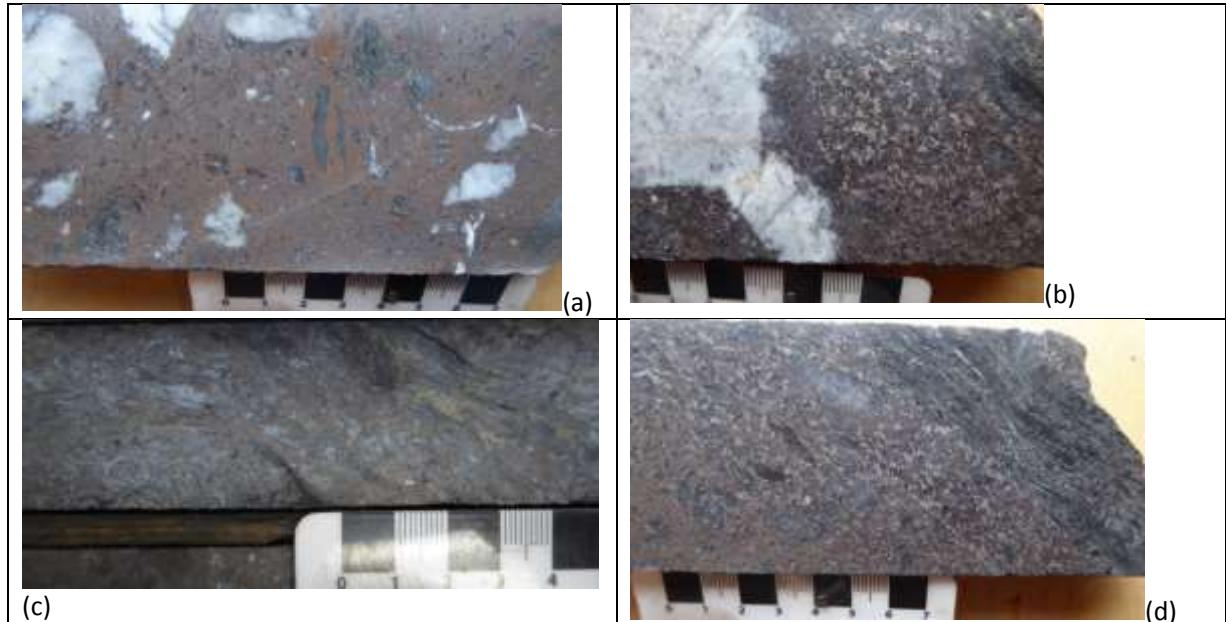

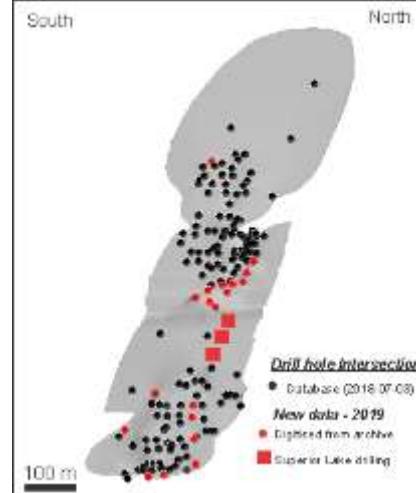

Criteria	Explanation	Commentary			
		<p>Mineralisation also contains inclusions of the host volcanic rocks (1-3%) which are commonly intensely foliated and altered to chlorite-biotite schists (Fig. A2.1a). Random orientation of the foliated inclusions indicate that deformation and displacement of the sulphide mass has continued after main peak of metamorphism. Intensity of foliation fabrics increases toward the contact of the massive sulphides (Fig. A2.1c), which are typically sharp (Fig.A2.1d).</p>  <p>(a) (b)</p> <p>(c) (d)</p>			

Fig. A2.1: Sulphide mineralisation of the Pick Lake deposit

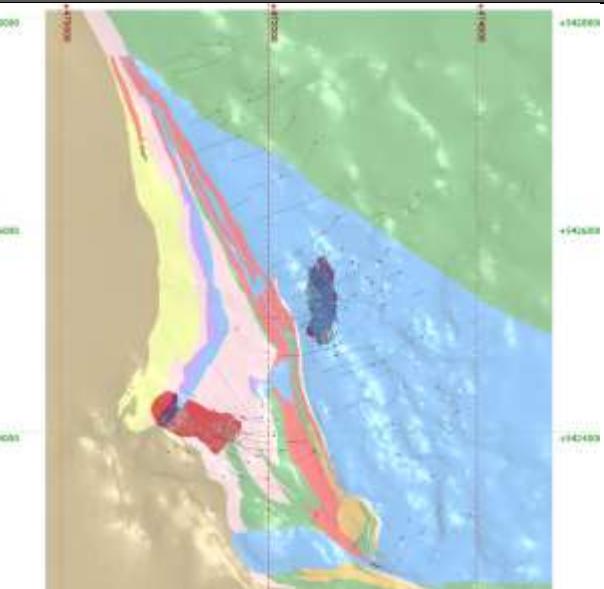

#### Winston Lake

The Winston Lake deposit lies at the top of the Winston Lake sequence within cherty exhalite and altered felsic-to-intermediate laminated ash tuff. In places, gabbro forms the hanging wall for the deposit. The

Criteria	Explanation	Commentary
		<p>footwall consists of altered mafic flow rocks and felsic-to-intermediate volcaniclastic rocks which are underlain by altered quartz and feldspar porphyritic rhyolite and feldspar pyritic basalt with intercalated sulphide-rich, bedded, tuffaceous rocks which, in turn, are underlain by the "Main" quartz feldspar porphyry which is intruded by gabbro and pyroxenite.</p> <p>Hydrothermal alteration, confined to the Winston Lake sequence, and later metamorphism of altered rock have resulted in assemblages of cordierite, anthophyllite, biotite, garnet, sillimanite, staurolite, muscovite and quartz coincident with an increase in iron, magnesium, and potassium and a decrease in sodium and calcium. Zinc content is directly proportional to the intensity of alteration.</p> <p>High copper values occur at the flanks and top of the alteration "pipe" with the core of the pipe containing relatively depleted copper values. The most common forms of ore are finely banded sphalerite and pyrrhotite and massive-to-coarsely banded sphalerite and pyrrhotite with minor pyrite and chalcopyrite and up to 45% of sub-angular mafic and felsic fragments averaging 3cm in diameter.</p> <p>The north-striking and 50 degrees eastwardly dipping deposit has a strike length of 750m and width of 350m. It has an average true thickness of 6m and is open to depth.</p>
<b>Drill hole Information</b>	<i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</i>  <i>easting and northing of the drill hole collar elevation or RL (Reduced</i>	<p>Resource definition database contains 1810 surface and underground drillholes.</p> <p>These includes 23 new drillholes that were added to the database after maiden resources were estimated and announced in 2018 (ASX 2018_07_03_SUP). The new data includes 3 drill holes drilled in 2019 by Superior Lake Resources (ASX announcement 7 March 2019) and 20 historic holes that were digitised from the archives (Fig. A2.2)</p>

Criteria	Explanation	Commentary
	<p><i>Level – elevation above sea level in metres) of the drill hole collar dip and azimuth of the hole down hole length and interception depth hole length.</i></p>	 <p><b>Drill hole intersections</b></p> <ul style="list-style-type: none"> <li>Database (2018_07_03)</li> <li>New data - 2019</li> <li>Digitised from archive</li> <li>Superior Lake drilling</li> </ul>
<b>Data aggregation methods</b>	<p><i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated</i></p>	<ul style="list-style-type: none"> <li>• Intercept grades are length weighted.</li> </ul> <p>No cut-off grades have been used.</p>

Criteria	Explanation	Commentary
<b>Relationship between mineralisation widths and intercept lengths</b>	<p><i>These relationships are particularly important in the reporting of Exploration Results.</i></p> <p><i>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</i></p> <p><i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').</i></p>	<ul style="list-style-type: none"> <li>Historical mining at Pick Lake and Winston Lake report mineralisation widths at Pick Lake to average of 2 to 4m and at Winston Lake to average 7m, which is concur with the 3D Resource model of the deposits.</li> </ul>
<b>Diagrams</b>		<ul style="list-style-type: none"> <li>Refer to body of announcement for figures. Generalised geological map of the project area is shown below.</li> </ul>

Criteria	Explanation	Commentary
		 <ul style="list-style-type: none"> <li>• Assay results for significant intercepts sourced from Inmet Mining Corp figures have been tabulated in Appendix 1.</li> </ul>
<b>Balanced reporting</b>	<p><i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i></p>	<ul style="list-style-type: none"> <li>• Assay results for significant intercepts sourced from Inmet Mining Corp figures have been tabulated in Appendix 1.</li> </ul>

Criteria	Explanation	Commentary
<b><i>Other substantive exploration data</i></b>	<p><i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i></p>	<p>Exploration activities carried out by other parties include surface geochemistry, drilling, surface geology mapping, VTEM, structural mapping.</p> <ul style="list-style-type: none"> <li>Continuity of mineralisation was studied and confirmed by DHEM survey that were described in the Section 1 of the JORC Table.</li> </ul>
<b><i>Further work</i></b>	<p><i>The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).</i></p>	<p>The following work is planned for the Pick Lake and Winston Lake Projects:</p> <ul style="list-style-type: none"> <li>To complete compilation of all drillhole hardcopy data into a drillhole database</li> <li>To complete scanning and digitising of underground drive geology mapping</li> <li>DGPS pick-up of all existing surface drillhole collars.</li> <li>Downhole survey measurements of existing surface drillholes (if possible)</li> <li>FLEM survey with an objective to identify the massive sulphide targets to the depth of 1000m (currently in progress)</li> <li>Preparation of the mine plans using the updated resource model</li> </ul>

Criteria	Explanation	Commentary
		Geochemical exploration in the eastern tenements, that currently are lacking of systematic exploration and known targets was not drilled

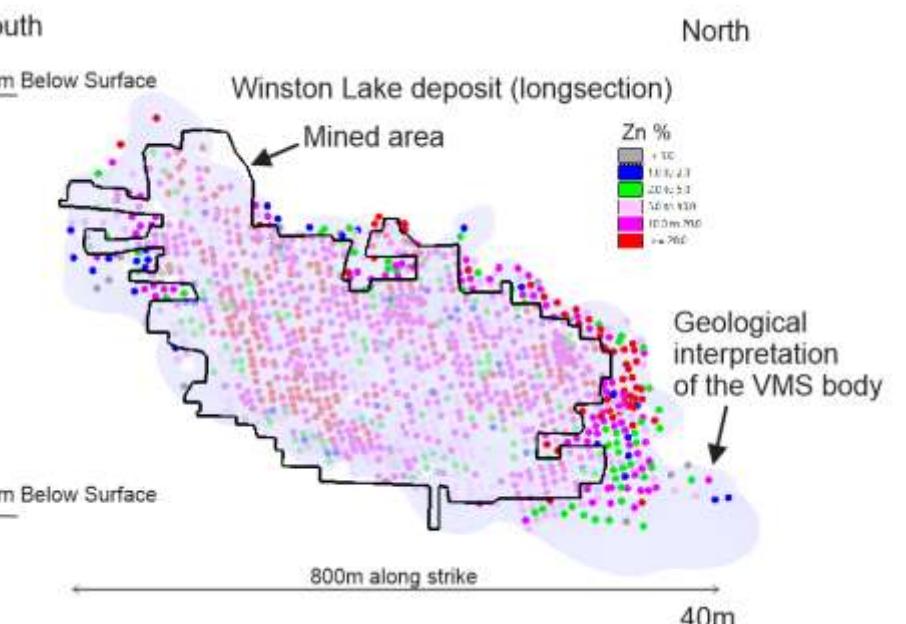

For personal use only

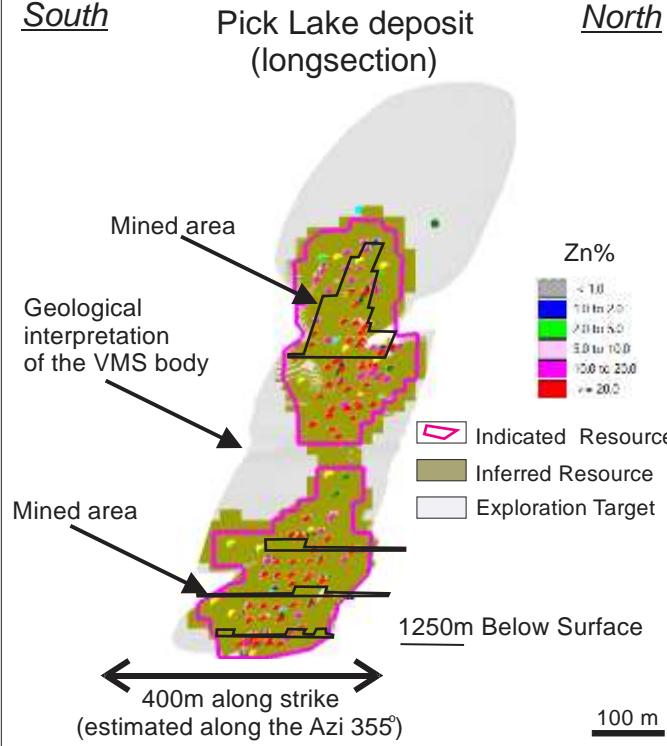

### Section 3 - Estimation and Reporting of Mineral Resources

Criteria	Explanation	Commentary
<b><i>Database integrity</i></b>	<i>Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.</i>	<ul style="list-style-type: none"> <li>• Superior Lake has compiled and validated Access database of drilling information, together with scanned images of interpreted level plans, sections, maps and other production related plans used in the preparation of the Mineral Resource estimate.</li> <li>• Drill holes data were digitised from the mine plans and cross-sections entry from hardcopy logs into Excel. All data in Excel was then checked against the original hardcopy logs including collar information, downhole surveying, geology logging and assays. Any errors detected in the Excel files was corrected.</li> <li>• Intervals not sampled were assigned a zero-grade value.</li> <li>• Drillholes were uploaded to 3D mining software packages for error detection and on and on-screen inspection and validation.</li> </ul>
	<i>Data validation procedures used.</i>	<ul style="list-style-type: none"> <li>• Data were loaded into 3D mining software packages and validation checks for location, downhole surveys, intervals and integrity were made. The data was also checked against plans, cross sections and long sections to detect any errors in data entry for both locations and downhole data.</li> </ul>
<b><i>Site visits</i></b>	<i>Comment on any site visits undertaken by the Competent Person and the outcome of those visits.</i>	<ul style="list-style-type: none"> <li>• Dr. M.Abzalov, the Competent Person (Resources) of the project has reviewed the historic data and the drill core of the holes that were available at the drillcore storage facilities of the Ontario Ministry of Northern Development and Mines in Thunder Bay, Ontario.</li> <li>• In February 2019 Dr. M.Abzalov has visited the project during drilling carried by Superior Lake and has reviewed the field procedures, with emphasis on drill holes logs and documentation quality, and also analysed the obtained drill core.</li> <li>• All field procedures observed were found satisfactory and complaint with the industry standards.</li> </ul>

Criteria	Explanation	Commentary
	<i>If no site visits have been undertaken indicate why this is the case.</i>	<ul style="list-style-type: none"> <li>• Site visit has been undertaken.</li> </ul>
<i>Geological interpretation</i>	<i>Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.</i>	<p>Pick-Winston Lakes camp VMS deposits, are a Noranda-style of the VMS-type deposits which are characterised by presence of the zinc - copper sulphide minerals core composed of sphalerite-chalcopyrite-pyrrhotite-pyrite (+/- gold, +/- galena, +/- tetrahedrite) which can be surrounded by pyrite-pyrrhotite halo with minor sphalerite, tetrahedrite and galena. The zoned distribution of the sulphide minerals is coupled with alteration patterns developed in the host rocks, with Mg-chlorite distributed at the core of the alteration pipe under the Cu-Zn deposit surrounded by sericite-quartz outer halo. Rocks at the vicinity to mineralisation appear a pervasive Na and to less extent Ca depletion, whereas Mg-rich core is also depleted in SiO<sub>2</sub>. Mineralisation of the studied deposits is essentially occurring as single massive sulphides seam distributed along the VMS horizon.</p> <p>A VMS type model was used as a basis for constraining the mineralisation using the Leapfrog methodology. The geological characteristics of the VMS type mineralisation are well understood and applied for delineating the mineralised bodies at the project.</p> <p>This implies that base-metal sulphide precipitates from volcanic exhalates on a sea floor or at a shallow depth close to the floor and forming the beds and lenses of massive and semi-massive sulphide mineralisation.</p> <p>Confidence in the model is high because the mineralisation of the studied deposits is essentially occurring as single massive sulphides seam distributed along the VMS horizon. The mineralisation and the host rocks stratigraphy can be delineated between the drill holes.</p> <p>The distances between drillholes intersecting the mineralisation are commonly from 10-30m (at the Winston Lake deposit to 20-40m at the Pick Lake deposit which is sufficient for a confident delineation of the mineralised bodies. The interpretation of the VMS bodies was confirmed by mapping and sampling of the underground developments which are also used for constraining VMS mineralised bodies in 3D.</p> <ul style="list-style-type: none"> <li>• The different interpretations can be suggested for extension of the mineralised bodies where they are not terminated by the barren drill holes</li> </ul>

Criteria	Explanation	Commentary
	<i>Nature of the data used and of any assumptions made.</i>	Geological interpretation and the resource model are based on the drillholes data (1810 drill holes) and underground developments
	<i>The effect, if any, of alternative interpretations on Mineral Resource estimation.</i>	<p>Not applicable. Mineral Resource domains are defined and constrained in 3D by the drillholes and the underground mapping/sampling data which has allowed to generate a robust geological interpretation of the mineralised bodies.</p> <p>The close distances between the drillholes intersecting the VMS strata and reasonably simple geometry of the mineralised bodies does not leave too much rooms for alternative geological interpretations.</p> <p>The differences can be related to the distances of extrapolation of the drillhole grades to the peripheral parts of the VMS bodies. In the current estimation this was approximately 75m with a minimum of 4 samples available for averaging the extrapolated grade.</p>
	<i>The use of geology in guiding and controlling Mineral Resource estimation.</i>	The Pick mineralisation was defined by intervals logged as massive and semi-massive sulphides within the Pick clotted rhyolite or tuff units. The assay values for zinc were compared to these intervals and found to correlate well. The zinc percent assay values were used to select intersections where no logging information was present. The interpretation of continuity was based on ore drive level plans that showed mapping information for the sulphide horizon. A nominal cut-off grade of 1% Zn was used to define the mineralised intervals which were used to construct a vein model. Edge boundaries were applied from ore drive extents and long-section mine plans that indicated the conductor boundary position from geophysical surveys.
	<i>The factors affecting continuity both of grade and geology.</i>	<p>Mineralisation of the studied deposits occur essentially as single massive sulphides seams (Pick Lake and Winston) distributed along the VMS horizon which controls the continuity of geology.</p> <p>This zoning, in particular zoned distribution of the Cu-rich and Zn-rich mineralisation, is observed at the studied deposits. Thickness and grade decreases to the peripheral parts of the VMS seams.</p>
<b>Dimensions</b>	<i>The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and</i>	<p>The project includes two deposits, Pick Lake and Winston. Location and dimensions of the mineralisation is shown on the longitudinal sections (Figures A3.1 and A3.2).</p> <p>The diagrams also contain the drillhole intersections</p>

Criteria	Explanation	Commentary
	<p><i>lower limits of the Mineral Resource.</i></p>	 <p>South North</p> <p>250m Below Surface</p> <p>Winston Lake deposit (longsection)</p> <p>Mined area</p> <p>Zn %</p> <ul style="list-style-type: none"> <li>+ 10</li> <li>1.0-3.4</li> <li>2.0-6.3</li> <li>5.0-10.0</li> <li>10.0-20.0</li> <li>&gt; 20.0</li> </ul> <p>Geological interpretation of the VMS body</p> <p>750m Below Surface</p> <p>800m along strike</p> <p>40m</p> <p>Fig.A3.1 Longitudinal section of the Winston Lake deposit</p>

Criteria	Explanation	Commentary
		 <p><b>Pick Lake deposit (longsection)</b></p> <p>The figure shows a longitudinal section of the Pick Lake deposit, oriented from South (left) to North (right). The deposit is elongated and irregularly shaped, situated 1250m below the surface. The section illustrates the geological interpretation of the VMS body, highlighting two 'Mined area' zones indicated by black arrows. The deposit is divided into three resource categories based on geological evidence:</p> <ul style="list-style-type: none"> <li><b>Indicated Resource</b> (pink outline)</li> <li><b>Inferred Resource</b> (brown shading)</li> <li><b>Exploration Target</b> (white background)</li> </ul> <p>A Zn% grade contour legend is provided, ranging from &lt; 1.0% (light grey) to &gt; 20.0% (red), with intermediate levels at 1.0 to 2.0%, 2.0 to 5.0%, 5.0 to 10.0%, and 10.0 to 25.0%. A scale bar indicates 100 m horizontally, and a vertical scale bar indicates 1250m Below Surface.</p> <p><b>Geological interpretation of the VMS body</b></p> <p><b>Mined area</b></p> <p><b>Mined area</b></p> <p><b>1250m Below Surface</b></p> <p><b>400m along strike (estimated along the Azi 355°)</b></p> <p><b>Zn%</b></p> <ul style="list-style-type: none"> <li>&lt; 1.0</li> <li>1.0 to 2.0</li> <li>2.0 to 5.0</li> <li>5.0 to 10.0</li> <li>10.0 to 25.0</li> <li>&gt; 20.0</li> </ul> <p><b>Legend:</b></p> <ul style="list-style-type: none"> <li>Indicated Resource (Pink outline)</li> <li>Inferred Resource (Brown shading)</li> <li>Exploration Target (White background)</li> </ul> <p><b>Fig.A3.2 Longitudinal section of the Pick Lake deposit</b></p>
<b>Estimation and modelling techniques</b>	<i>The nature and appropriateness of the estimation technique(s) applied and key assumptions, including</i>	<p>Estimation of the mineralisation grade was made using Ordinary Kriging (OK) technique that was applied to Zn, Cu, Au and Ag.</p>

Criteria	Explanation	Commentary

	Spherical - 2	0.07	90	90	11

After completion of the estimation the block model have been transferred back to Micromine and estimated block grades have been copied to corresponding them sub-cells.

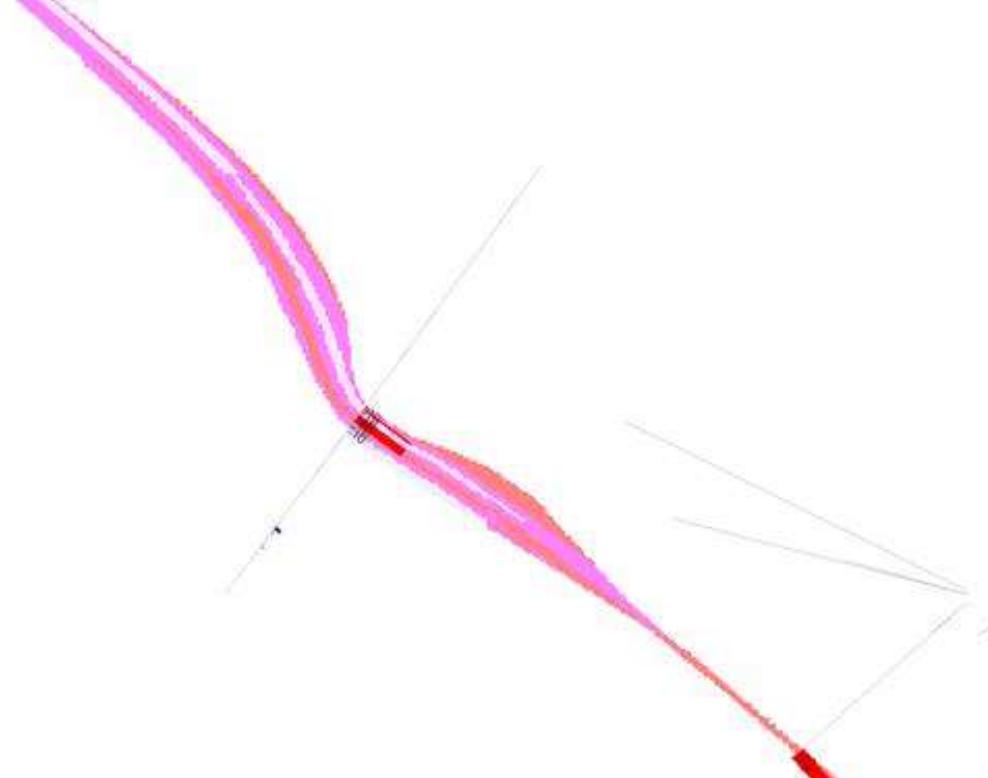

Criteria	Explanation	Commentary						
	<i>The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.</i>	<p>Previous estimate of the Pick resources made in 2018 was 1.84 Mt @ 18.8%Zn  The 2019 estimate is 2.06 Mt @ 18.3 % Zn  The increase of the resources is related to additional drillholes that has allowed to extend the resources and as a result of this, Lower and Upper Pick domains have joined into a single stratiform massive sulphide body.</p>						
	<i>The assumptions made regarding recovery of by-products.</i>	<p>The main metals are Zn and Cu. Mineralisation also contains Au and Ag which are by-products. All four metals were estimated into the block model. Cu, Au and Ag grades are reported within the Zn resource ie., the associated minerals are not reported as separate domains.</p> <p>It is likely that silver will have a similar recovery to that of the copper. This assumption is made because of strong correlation between these metals indicating that silver is likely present as a mixture of chalcopyrite which is the main copper mineral at this project.</p> <p>Historical Recoveries or by-products during the 11 years of processing in the concentrator at the site were:</p> <table> <tr> <td>Copper</td> <td>77 %</td> </tr> <tr> <td>Gold</td> <td>32 %</td> </tr> <tr> <td>Silver</td> <td>36 %</td> </tr> </table>	Copper	77 %	Gold	32 %	Silver	36 %
Copper	77 %							
Gold	32 %							
Silver	36 %							
	<i>Estimation of deleterious elements or other non-grade variables of economic significance (e.g.</i>	<p>Deleterious elements were not analysed and were not used in the current estimation.</p> <p>From production records and environmental monitoring of water discharge the concentrates were known to not host deleterious material, and after 30 years there is no record or indication of heavy metal impacts to the environment from water discharge.</p>						

Criteria	Explanation	Commentary
	<i>sulphur for acid mine drainage characterisation).</i>	
	<i>In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.</i>	<p>The distances between drillholes intersecting the mineralisation are commonly from 10-30m (at the Winston Lake deposit to 20-40m at the Pick Lake deposit which is sufficient for a confident delineation of the mineralised bodies.</p> <p>The parent blocks were 20x20x1m which is in a good accordance with the drilling grids.</p> <p>At the peripheral parts of the Pick Lake deposit the drill spacing is broader, however, usually not farther than 60-80m therefore the chosen blocks size (20x20x1) is also compliant with the drill spacings in these areas.</p>
	<i>Any assumptions behind modelling of selective mining units.</i>	<p>The mining methods used at this project include mechanised AVOCA and Alimak stoping. Neither of these methods are planned to be used, with the adoption of a sublevel longhole stoping method with introduced paste fill being proposed on the resumption of operations. It is assumed that mining selectivity will be approximately in the range of 10x10x1 to 20x20x1m. The used block size for estimation resources was 20x20x1m, which corresponds to assumed size of the SMU blocks</p>
	<i>Any assumptions about correlation between variables.</i>	 <p>Fig. A3.3: Ag vs Cu diagram, Pick Lake deposit drill hole data</p>

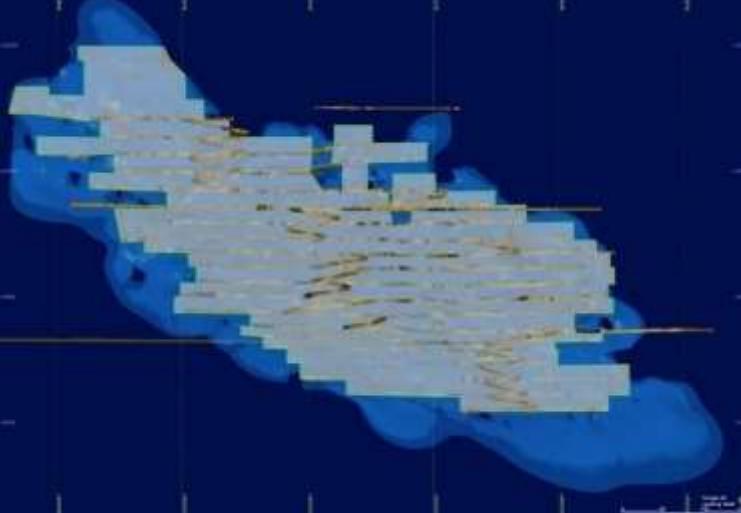

Criteria	Explanation	Commentary
		Cu and Ag appear a strong correlation (Fig.A3.3), with coefficient of correlation (rho) equal to 0.87. Between other metals correlation is insignificant or lacking
	<i>Description of how the geological interpretation was used to control the resource estimates.</i>	VMS type model was used as a basis for constraining the mineralisation using the LeapFrog methodology. According to this model the base-metal sulphides precipitate from volcanic exhalates on a sea floor and form the planar beds and lenses of massive sulphide mineralisation.  This interpretation was implemented as 3D wireframes of the VMS seams that were created using Leapfrog software
	<i>Discussion of basis for using or not using grade cutting or capping.</i>	High grade cut-off was applied to all metals. The cut off values, determined at approximately 2% on the probability curve, were as follows: Zn - 38% Cu - 2.4% Au - 0.7 g/t Ag - 95 g/t  These values were applied as a lower cut off if the estimated block was located at the distance of 30m and larger from the data point.
	<i>The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.</i>	Estimation was validated by plotting the block grades vs corresponding them sample grades. The data have been grouped into 40m panels drawn across the VMS bodies.

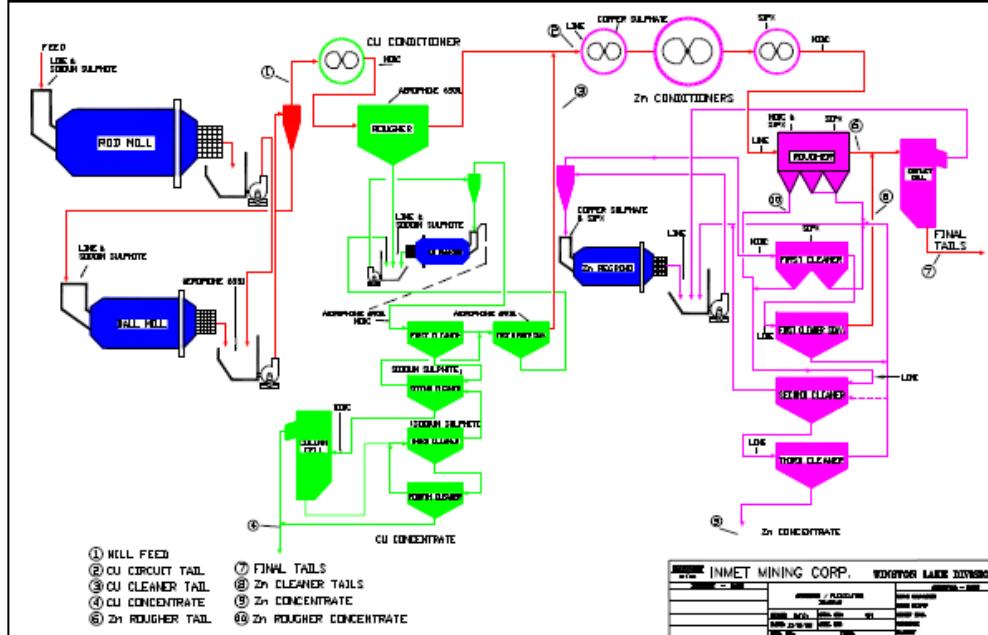

Criteria	Explanation	Commentary
		 <p><i>Fig. A3.4. Swath plot comparing block model and sample grades, Pick Lake deposit</i></p> <p>The diagram (Fig. A3.4) shows that the model properly honours the drillhole data and accurately reproduces the local variability of the grade.</p> <p>The model was also visually expected and compared with the drillholes data. Review of the model by cross-sections has shown that the model accurately reproduces layering and zoning of the VMS seam (Fig. A3.5).</p>

Criteria	Explanation	Commentary
<b><i>Environmental factors or assumptions</i></b>	<i>Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential</i>	<p>The Winston Lake - Pick Lake project is free of environmental liabilities.</p> <p>The environmental considerations are limited to the site rehabilitation, including the stockpile area, sedimentation basins, and building foundations. Restoration works have been completed except for the building foundations.</p> <p>Monitoring of the water quality from the mine started at mine closure and will be required for a period of 10 years  The CP has been advised there are no impediments to recommencement of mining activities.</p>

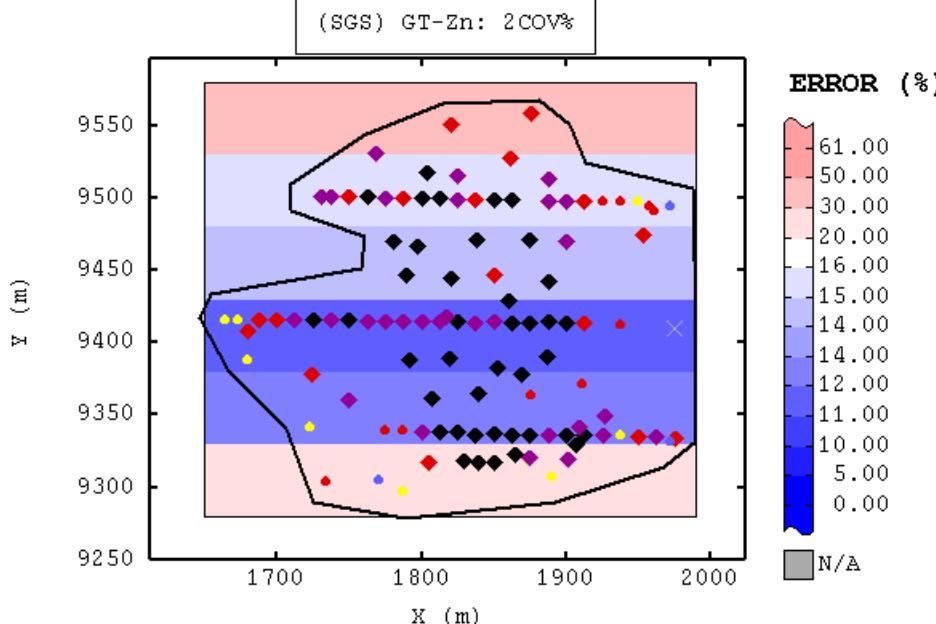

Criteria	Explanation	Commentary
	<i>environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.</i>	
<b>Bulk density</b>	<i>Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.</i>	<p>654 samples have measured SG and 714 samples have CSG (calculated SG) where:</p> $\text{CSG} = (((100-S\%)*2.7+R\%*5+( R\%*(Po\%+0.001)/(Py\%+0.001))*4.6) +Cu\%/0.3*4.1+Zn\%/0.6*3.9)/100$ <p>S% =Sulphide % calc, R% = re-Py%</p>
	<i>The bulk density for bulk material must have been measured by methods that adequately account</i>	<p>The Superior Lake Ltd geological team believes that the techniques used for measuring the rock density are compliant with the Canadian mining industry practices. The measured values have been confirmed by the mine production. Estimated (CSG) densities well correlates with measured densities (SG) (Fig. A3.8) and they are suitable for resource estimation.</p>

Criteria	Explanation	Commentary
	<p><i>for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.</i></p>	<p style="text-align: center;"><b>Pick-Winston SG/CSG Comparison</b></p>  <p style="text-align: center;"><b>Fig. A3.8: Calculated density (CSG) vs measured density (SG)</b></p>
	<p><i>Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.</i></p>	<p>The density values have been estimated into the block model using ordinary kriging. This has allowed to obtain the more accurate local estimates of the densities, in particular in the high-grade areas</p>
<b>Classification</b>	<p><i>The basis for the classification of the Mineral Resources</i></p>	<p>The blocks were classified as Indicated Resource if the block is located at the distance in the unfolded space approximately 40(X) x 40(Y)m from the nearest drillhole (Fig. A3.9).</p>

Criteria	Explanation	Commentary
	<i>into varying confidence categories.</i>	<p>Other blocks, that were estimated by the pass-2 of kriging (Pick Lake: search radii 60x60x4m and minimum 1 samples) (Winston lake: search radii 60x60x6m and minimum 6 samples) and located outside of the 40x40m area were classified as Inferred.</p>  <p>South North</p> <p>Geological interpretation of the VMS body</p> <ul style="list-style-type: none"> <li>■ Indicated Resource</li> <li>■ Inferred Resource</li> <li>□ Exploration Target</li> </ul> <p>400m along strike (estimated along the Azimuth 355)</p> <p>100 m</p>
	<i>Whether appropriate account has been taken of all relevant factors (ie relative confidence</i>	<p>All relevant data and factors were taken into account for this resource estimation. This includes</p> <ul style="list-style-type: none"> <li>• A good understanding of geology and the style of mineralisation;</li> <li>• Geophysical data which is in accordance with the geological interpretation confirming continuity of mineralisation</li> <li>• Geostatistically estimated grade and geology</li> <li>• Geostatistically estimated (using conditional simulation) level of grade uncertainty and based on this, using an optimal drill spacings for classification of mineralisation as indicated resources</li> </ul>

Criteria	Explanation	Commentary
	<i>in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).</i>	
<b>Audits or reviews</b>	<i>The results of any audits or reviews of Mineral Resource estimates.</i>	An alternate resource estimation was completed in 2018 by independent consultant Mr Alfred Gillman, who used an inverse squared distance estimation methodology. The results are consistent with the reported tonnes and grade and support the 2019 Mineral Resource estimate.
	<i>Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to</i>	<p>Confidence in this Mineral Resource estimate was assessed using conditional simulation technique (SGS method) applied to the data of the central part of the Lower Pick domain, which was prepared for production by developing the underground drives. The distribution of the drillhole in this area is approximately 35 x 35m grid.</p> <p>A 2D model was constructed for estimation uncertainty in estimated metal accumulations, GT-Zn m%. (GT denotes the product of Zn grade by horizontal thickness of the intersection).</p> <p>Two estimation errors were deduced from the SGS model, the global error for entire Lower Pick domain and local estimate. The latter was obtained for 50m panels drawn through the entire strike length of the Lower Pick domain (Fig. 10). These 50m panels correspond to approximately 1 year of the mine production, therefore the estimated error corresponds to uncertainty in the estimated annual production.</p> <p>Results of the SGS method are as follows:</p> <p>Average GT-Zn of the Lower Pick domain is estimated with an error +/- 7.7% (at 0.95 CL)</p>

Criteria	Explanation	Commentary
	<p><i>quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.</i></p>	<p>Average GT-Zn of the 50m panels (annual production) are estimated with an average error <b>+/-14.6%</b> (range 11.1 – 20.4%). These results were a basis for choosing a drill grid of approximately 30-40 x 30-40m grid as criteria for classification mineralisation as Indicated resource</p>
	<p><i>The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made</i></p>	<p>The obtained GT-Zn uncertainty relates to global and local estimates. Global estimate includes the central area of the Lower Pick domain that was essentially prepared for production (Fig. A3.10). Local estimates is made by 50m through the Lower Pick domain (Fig.A3.10). The panels represent approximately 1 year of the mine production.</p>

Criteria	Explanation	Commentary
	<i>and the procedures used.</i>	 <p>The figure is a longsection plot showing the distribution of errors in estimated GT-Zn m% values across the Lower Pick domain area. The vertical axis represents depth (Y) in meters, ranging from 9250 to 9550. The horizontal axis represents distance (X) in meters, ranging from 1700 to 2000. The plot is divided into several geological domains, each represented by a different color: light red, light blue, dark blue, and black. Drill hole intersections are plotted as dots of various colors (red, purple, yellow, black). A color scale bar on the right indicates the error percentage, ranging from 0.00% (blue) to 61.00% (red), with intermediate values at 10.00%, 12.00%, 14.00%, 15.00%, 16.00%, 20.00%, 30.00%, 50.00%, and 61.00%. An 'N/A' label is present at the bottom of the color scale. A legend in the top right corner specifies '(SGS) GT-Zn: 2COV%'.</p> <p>Fig. A3.10: Longsection of the Lower Pick domain area showing errors in estimated GT-Zn m% values. Dots demote the drill hole intersections</p>
	<i>These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.</i>	Not applicable – production data not yet available.
