## SOYBEAN AGRONOMIC TESTS CONFIRM HIGH QUALITY TRÊS ESTRADAS NATURAL PHOSPHATE FERTILIZER

**Sydney, Australia**, - Aguia Resources Limited ABN 94 128 256 888 (ASX:AGR) (**'Aguia'** or **'the Company'**) is pleased to report the first results from a sequence of ongoing agronomic tests of the Três Estradas Phosphate Project Direct Application Natural Fertilizer (DANF) product.

### Highlights

- Soybeans are Rio Grande do Sul's (RS) primary agronomic commodity with over 5.7m HA of crops that yielded more than 19 million tons in the 2018/2019 harvest.
- The ongoing agronomic tests are being conducted by independent consultants Integrar Gestão e Inovação Agropecuária at their test field in Capivari do Sul, RS.
- Results demonstrate that saprolites from both the carbonatite (CBTSAP) and the amphibolite (AMPSAP) are very effective sources of phosphate for the soybean crops.
- Productivity results demonstrate high potential for the application of DANF and its ability to replace conventional phosphate fertilizers.

### Management Commentary

**Managing Director Dr. Fernando Tallarico said:** "These first results on the agronomic efficiency of our DANF are most positive. The Três Estradas DANF was tested in the same conditions as other conventional phosphate fertilizers known to have high solubility, and they performed very well. The results are well beyond our initial expectations and confirm the high quality of the Três Estradas phosphate fertilizer."

"The soybean productivity results confirm the efficiency of our DANF in delivering phosphate to the soybean growing industry in Brazil which contributes significantly to the local economy. It is the main agronomic commodity produced in the State of Rio Grande do Sul, with over 5.7 million hectares of soybean crops that yielded more than 19 million tons in the 2018/2019 harvest.

## Background

As previously reported in the ASX 19 March 2020 announcement: “Positive Results from Agronomic Tests on the Natural Phosphate from Três Estradas Project”, the Company intends to produce a Direct Application Natural Fertilizer (DANF) product at its Três Estradas Phosphate Project to be classified as a “Natural Phosphate” in accordance with the guidelines of the Brazilian Ministry of Agriculture, Livestock and Supply (MAPA).

Integrar Gestão e Inovação Agropecuária (“Integrar”), a renowned agronomic consulting firm located in southern Brazil, was engaged to conduct a series of agronomic efficiency tests on the Três Estradas DANF as a source of phosphorous (P) for crops. These tests are being conducted at Integrar’s Agronomic Station located in Capivari do Sul, RS. Two types of processed ore are being used in the agronomic tests, carbonatite saprolite (CBTSAP) and amphibolite saprolite (AMPSAP).

The agronomic performance tests determine how efficiently the P-nutrient is delivered to the soil and then to the crop. Test #1 is currently ongoing in the field and will evaluate three crops (soybean, ryegrass, and rice) to determine the reactivity and availability of the P-nutrient from CBTSAP and AMPSAP<sup>1</sup> to the plants, and to determine its agronomic value. The test commenced in late November 2019 on soybean, the 2019/2020 summer crop, and will be followed by ryegrass in the 2020 winter crop and finally rice in the 2020/2021 summer crop. The soybean plants were harvested in April and the ryegrass then seeded in mid-May. In this announcement we are presenting the results of test on the 2019/2020 soybean crop.

Test #1 consists of 16 distinct agronomic treatments listed in Table 1. These treatments consist of different sources of phosphate for comparison purposes, including conventional phosphate fertilizers such as; Super-simple Phosphate (SSP), Triple Superphosphate (TSP), Monoammonium Phosphate (MAP), and Natural Phosphate from Morocco (NP). Treatments with distinct quantities of our DANF products (CBTSAP and AMPSAP), a combination of CBTSAP and AMPSAP with MAP, and a phosphate solubilizer known as BiomaPhos was also tested. The test was replicated four times with the sequence of blocks randomised for each treatment.

The application rate of the nutrients in each treatment was as follows:

- Nitrogen (N): 20 kg/ha of N in treatments T2 to T16. In treatments T12 to T16, the content of N in MAP was discounted from this amount;
- Potassium (K): 200 kg/ha of KCl (Potassium chloride) in treatments T2 to T16;
- Phosphate dosage P1: 50 kg/ha of P<sub>2</sub>O<sub>5</sub>;
- Phosphate dosage P2: 100 kg/ha of P<sub>2</sub>O<sub>5</sub>.

Treatment	Dosage	Sources of P
T1	Control	No source of N, P and K applied
T2	N+K	No source of P applied
T3	N+K+P1	CBTSAP
T4	N+K+P1	CBTSAP + BiomaPhos (phosphorus solubilizer)
T5	N+K+P2	CBTSAP
T6	N+K+P1	AMPSAP
T7	N+K+P1	AMPSAP+ BiomaPhos (phosphorus solubilizer)
T8	N+K+P2	AMPSAP
T9	N+K+P1	Natural Phosphate Morocco (NP)
T10	N+K+P1	Triple Super Phosphate (TSP)
T11	N+K+P1	Simple Super Phosphate (SSP)
T12	N+K+P1	MAP
T13	N+K+P2	¼ via CBTSAP + ¾ via MAP
T14	N+K+P2	½ via CBTSAP + ½ via MAP

<sup>1</sup> CBTSAP is the acronym for the saprolite of the carbonatite which is Três Estradas’ higher-grade Natural Phosphate Fertilizer grading about 10% P<sub>2</sub>O<sub>5</sub>. CBTSAP is our main product as it represents more than 80% of the resource. The AMPSAP is the acronym for saprolite of Amphibolite which is a relatively lower-grade Natural Phosphate Fertilizer grading in average 4.5% P<sub>2</sub>O<sub>5</sub> and represents about 17% of the Três Estradas resource.

T15	N+K+P2	¼ via AMPSAP + ¾ via MAP
T16	N+K+P2	½ via AMPSAP + ½ via MAP

**Table 1 – Summary of treatments on soybean in the field.**

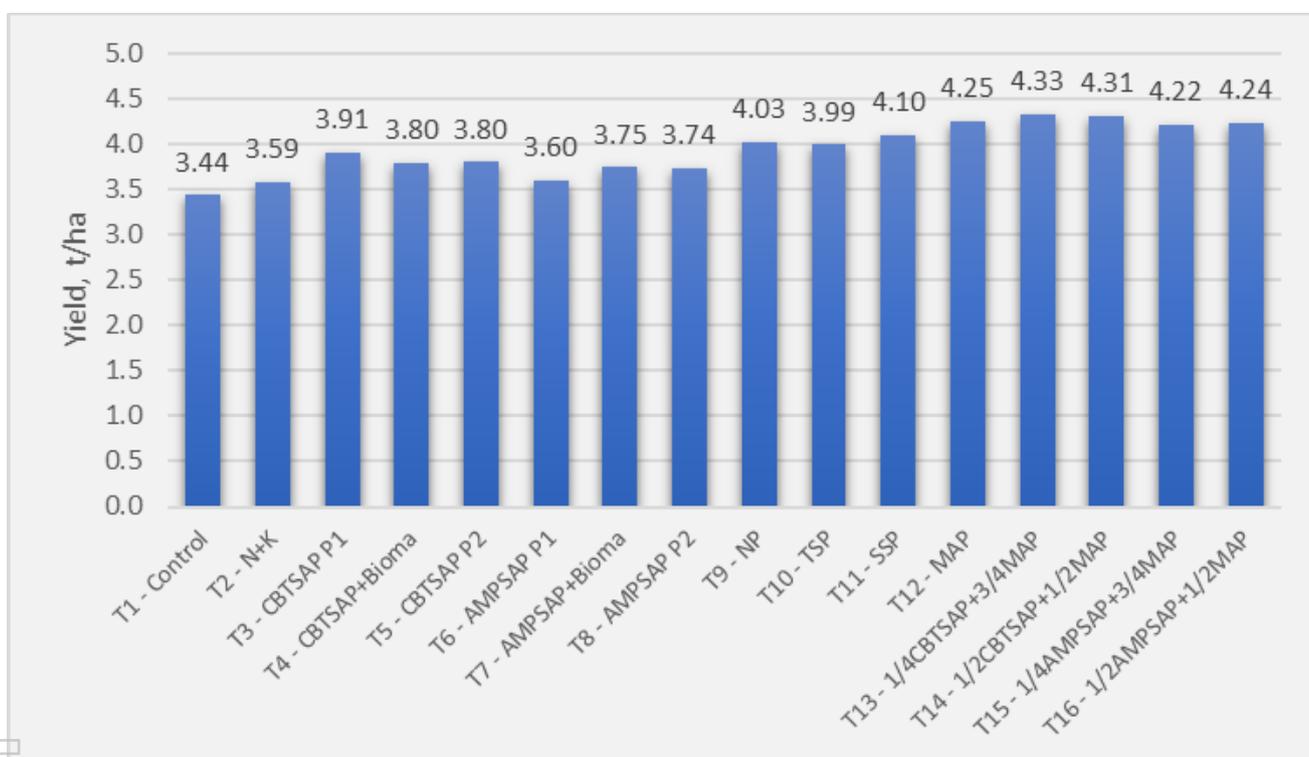

**Test #1 – Soybean Productivity**

The soybean yield that resulted from each treatment is shown in Figure 1.

Treatment T13, the application of 100 kg/ha of P<sub>2</sub>O<sub>5</sub> (25% CBTSAP and 75% MAP), resulted in the highest soybean yield of all treatments with 4.33 t/ha, followed by treatment T14, the application of 100 kg/ha of P<sub>2</sub>O<sub>5</sub> (50% CBTSAP and 50% MAP), with a yield of 4.31 t/ha.

Treatment T3, CBTSAP in a P<sub>2</sub>O<sub>5</sub> dosage of 50 kg/ha resulted in a yield of 3.91 t/ha, which equates to 98% of the yield achieved using the conventional fertilizer TSP (3.99 t/ha) (T10), 97% of the NP yield (4.03 t/ha) (T9), 95% of the SSP yield (4.10 t/ha) (T11), and 92% of the MAP yield (4.25 t/ha) (T12).

Treatment T8, AMPSAP in a P<sub>2</sub>O<sub>5</sub> dosage of 100 kg/ha resulted in a yield of 3.74 t/ha, which equates to 95% of the yield achieved by CBTSAP in a dosage of 50 kg/ha (3.91 t/ha) (T3), 93% of the SSP yield (T11) and 88% of the MAP yield (T12).

**Figure 1 – Soybean yield resulting from each treatment under Test #1. 2019/2020 harvest in Capivari do Sul, RS, Brazil.**

The phosphate in Test #1 was applied by launching, which tends to be less effective in promoting solubilization (especially for natural phosphates) and can affect the availability of the nutrient to the plant. The soybean that was treated with the application of our fertilizers, CBTSAP and AMPSAP, returned yields that exceeded expectations for a first production cycle. The expectation is that in a short time period, the differences in productivity between the conventional phosphate fertilizers, and CBTSAP and AMPSAP, will be further reduced or be negligible. This is because of the cumulative effect of the fertilizer in the soil over time, which favours Natural Phosphates as they are slower release products.

### Test #1 – Phosphorus in the Soil

After the harvest, the 0 to 10 cm layer of the soil was sampled and assayed to determine the phosphorus (P) content. The results indicate a good P solubilization of CBTSAP and AMPSAP in the soil five months after application. In some cases, the level of P in the soil after the application of AMPSAP, exceeded the residual in the soil after the application of conventional phosphate fertilizers, including STP and SSP (Figure 2).

The P grades in the soils that received CBTSAP and AMPSAP treatments are significantly higher than the P grade in the soils with control treatment (T1), where there is no addition of P. The CBTSAP in a dosage of 50 kg/ha resulted in 11.8 mg/dm<sup>3</sup> of P in the soils (T3), grading similarly to treatments with TSP (12.3 mg/dm<sup>3</sup>) (T10) and SSP (13.2 mg/dm<sup>3</sup>) (T11). The higher dosage of CBTSAP (100 kg/ha) reached 15.1 mg/dm<sup>3</sup> of P in the soils (T5) and the combination of CBTSAP (50%) and MAP (50%) in the dosage of 100kg/ha resulted in the highest level of P in the soils (19.6 mg/dm<sup>3</sup>) (T14).

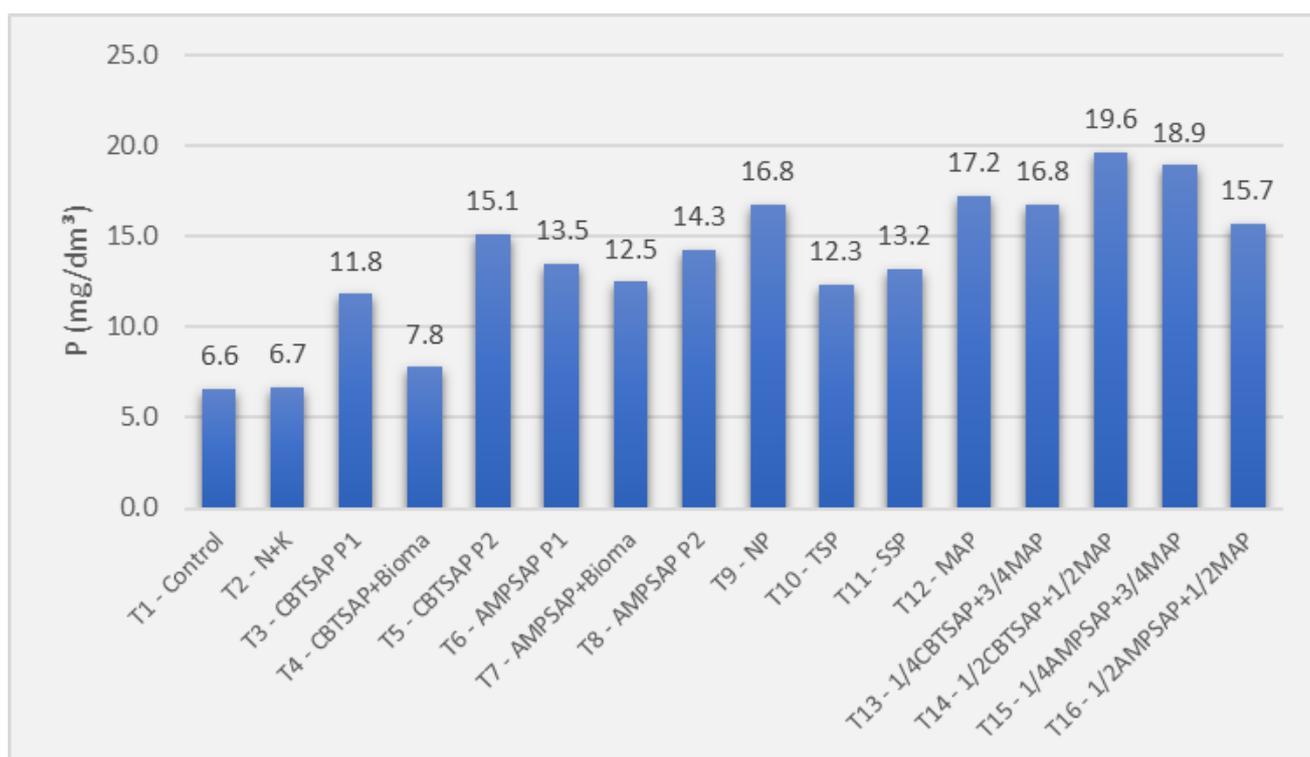

Figure 2 – Phosphorous grades in the 0 to 10 cm layer of soil after the soybean harvest for each treatment under Test #1. Harvest 2019/2020. Capivari do Sul, RS, Brazil.

The application of CBTSAP and AMPSAP was effective in improving the P rates in the soil after the soybean harvest and demonstrated good residual content which should increase through successive crop cycles.

### **About Aguia:**

Aguia Resources Limited, ("Aguia") is an ASX listed company whose primary focus is on the exploration and development of mineral resource projects in Brazil including copper and phosphate. Aguia has an established and highly experienced in-country team based in Rio Grande State, Southern Brazil. Aguia has multiple copper targets. It has recently undertaken extensive geophysical analysis and is awaiting the results of recent copper drilling. Aguia is also in the pre-production stage of a low-cost natural phosphate fertiliser project which is the subject of its recently released Scoping Study. It is expected to be operational in early 2022.

### **JORC Code Competent Person Statements:**

The information in this report that relates to Exploration Targets, Exploration Results, Mineral Resources or Ore Reserves is based on information compiled by Dr. Fernando Tallarico, who is a member of the Association of Professional Geoscientists of Ontario. Dr. Tallarico is a full-time employee of the company. Dr. Tallarico has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Dr. Tallarico consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

### **Caution regarding forward-looking information:**

This press release contains "forward looking information" within the meaning of applicable Australian securities legislation. Forward looking information includes, without limitation, statements regarding the next steps for the project, timetable for development, production forecast, mineral resource estimate, exploration program, permit approvals, timetable and budget, property prospectivity, and the future financial or operating performance of the Company. Generally, forward looking information can be identified by the use of forward-looking terminology such as "plans", "expects" or "does not expect", "is expected", "budget", "scheduled", "estimates", "forecasts", "intends", "anticipates" or "does not anticipate", or "believes", or variations of such words and phrases or state that certain actions, events or results "may", "could", "would", "might" or "will be taken", "occur" or "be achieved". Forward-looking information is subject to known and unknown risks, uncertainties and other factors that may cause the actual results, level of activity, performance or achievements of the Company to be materially different from those expressed or implied by such forward-looking information, including, but not limited to: general business, economic, competitive, geopolitical and social uncertainties; the actual results of current exploration activities; other risks of the mining industry and the risks described in the Company's public disclosure. Although the Company has attempted to identify important factors that could cause actual results to differ materially from those contained in forward-looking information, there may be other factors that cause results not to be as anticipated, estimated or intended. There can be no assurance that such information will prove to be accurate, as actual results and future events could differ materially from those anticipated in such statements. Accordingly, readers should not place undue reliance on forward looking information. The Company does not undertake to update any forward-looking information, except in accordance with applicable securities laws.

Criteria	JORC Code Explanation	Commentary
Exploration done by other parties	<ul style="list-style-type: none"> <li>Acknowledgment and appraisal of exploration by other parties.</li> </ul>	<ul style="list-style-type: none"> <li>Lavras do Sul was originally developed in the 1880's as a gold mining camp on the Camaquã of Lavras River. In 1959, more detailed studies were organized by the ANM, which were followed in the 1970s by major survey and sampling programs of all mineral occurrences by the Companhia de Pesquisa e Recursos Minerais (CPRM – The Geological Survey of Brazil). In recent years there have been renewed exploration activities for gold and base metals in the region by Companhia Brasileira do Cobre (CBC), Amarillo Mining, Companhia Riograndense de Mineração (CRM) and Votorantim Metais Zinco SA.</li> <li>Phosphate mineralization was first observed at Três Estradas in a gold exploration program being conducted jointly by Santa Elina and CBC. Santa Elina was prospecting for gold in ANM #810.090/1991, conducting soil, stream sediment and rock geochemistry, ground geophysical surveys (magnetometry and induced polarization) and a limited drilling program.</li> <li>Exploration results for gold were not encouraging and Santa Elina pulled out of the joint venture with CBC. However, the phosphate chemical analysis from two core boreholes in the ANM #810.090/1991 area yielded results of 6.41% P<sub>2</sub>O<sub>5</sub> from soil and 6.64% P<sub>2</sub>O<sub>5</sub> from core. This information was communicated to CPRM.</li> <li>Following petrographic studies, apatite mineralization occurring in carbonatite was confirmed. In July 2011, CBC entered into a partnership with Aguia Metais Ltda, a subsidiary of Aguia Resources Ltd., to explore and develop phosphate deposits in Rio Grande do Sul State.</li> </ul>

Criteria	JORC Code Explanation	Commentary
Geology	<ul style="list-style-type: none"> <li>Deposit type, geological setting and style of mineralisation.</li> </ul>	<ul style="list-style-type: none"> <li>The Três Estradas Phosphate Project is situated in the Santa Maria Chico Granulitic Complex (SMCGC), part of the Taquembó domain (<b>Error! Reference source not found.</b> below). The SMCGC exposes the deepest structural levels within Brazil and may represent the western edge of the Precambrian Rio de la Plata Craton. The Três Estradas deposit consists of an elongated carbonatite intrusion (meta-carbonatite and amphibolite) with a strike of 50° to 60°. The meta-carbonatite and amphibolite form a tightly folded sequence with limbs dipping steeply from 70° to vertical (90°). The surface expression of the intrusion is approximately 2.5 km along strike with a width of approximately 300m. The Late Archean to Early Proterozoic intrusion is intensely recrystallized and metamorphosed to amphibolite assemblages. The carbonatite intrusion is bound mostly by biotite gneiss along with meta-syenite along its northeast and southeast boundaries</li> <li>Phosphate mineralization, occurring as the mineral apatite (Ca<sub>5</sub>(PO<sub>4</sub>)<sub>3</sub>(F,Cl,OH)), is the primary mineralization of economic interest at Três Estradas. Apatite is the only phosphate-bearing mineral occurring in the carbonatites. At Três Estradas phosphate mineralization occurs in both fresh and weathered meta-carbonatite and amphibolite. Phosphate also becomes highly enriched as secondary mineralization in the overlying saprolite.</li> </ul>
Drill Hole Information	<ul style="list-style-type: none"> <li>A summary of all information material to the understanding of the</li> </ul>	<ul style="list-style-type: none"> <li>Tres Estradas project have 383 drillholes including diamond drillholes and RC drillholes. - Drillhole location map and total magnetic field geophysical survey map
- Mineral processing and metallurgical testing for the Tres Estradas Phosphate project has been ongoing since 2012. Over that time the understanding of the metallurgical properties and characteristics of the ore and its response to various processes to concentrate and recover phosphate has gradually improved as a series of studies have steadily increased their relevance and level of detail. The most current level of work reflects a well-developed and considered approach to phosphate recovery that is optimized and verified to a level suitable to support a selection of a process route as well as the basis for preliminary
- equipment sizing.
- In 2015 a beneficiation bench-scale study was conducted on carbonatite and saprolite ore samples by SGS. This study confirmed phosphate recoveries of the previous study. Additionally, the slimes (-20µm) fraction

Criteria	JORC Code Explanation	Commentary
		<p>were very significant, with similar chemical composition to the coarse fractions, which if discarded would result in high losses of P<sub>2</sub>O<sub>5</sub>.</p> <ul style="list-style-type: none"> <li>• Eriez began their engagement with a program in 2016 that produced concentrates from various ore types at a commercially viable level of performance using column flotation. Preliminary bench-scale testing was performed using mechanical test cells in order to optimize the process approach, which was then tested using columns.</li> <li>• Metallurgical and process testing has culminated in Eriez’s most recent pilot-plant testing for flotation (2017), supported with a recent comminution study. A multimonth study, using bulk samples and performed at Eriez Flotation Division’s pilot-plant facilities in Pennsylvania, USA, has confirmed the earlier bench-scale work as well as further improvements in the process design to improve grade - recovery projections</li> <li>• The agronomic efficiency experiment was designed to use randomized blocks with four replications.</li> </ul>
Further work	<ul style="list-style-type: none"> <li>• The nature and scale of planned further work (eg. tests for lateral extensions or depth extensions or large-scale step-out drilling).</li> <li>• Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</li> </ul>	<ul style="list-style-type: none"> <li>• Millcreek considers the exploration data collected by Agua to be of sufficient quality to support mineral resource evaluation.</li> </ul>
