960.1ppm TREO in Historic Surface Sample at Mt Clere Rare Earth and Lithium Project

- **960.1ppm maximum TREO recorded in surface sampling discovered in review of historical geochemistry data**
- **Review also highlights areas of interest that correspond with elevated Strontium, Niobium and TREO**
- **Geological model of fenite alteration potentially associated with rare earth mineralisation supported by historical results and current interpretation**
- **Field reconnaissance and sampling program completed, with rock chip samples from key target areas sent for quick turnaround of assays**
- **Systematic exploration programs planned for extensive gridded auger sampling over key target areas and the Durlacher Supersuite, host to Hastings Yangibana REE deposit**
- **Magnetic, radiometric and ground gravity geophysical surveys being assessed and may be utilised prior to drilling**
- **The Mt Clere region in the eastern Gascoyne is seeing a renewed focus of exploration for critical minerals with Krakatoa Resources (ASX.KTA)¹ recently discovering ionic-clay hosted REE's and Askari Mining (ASX.ASK)² discovering lithium pegmatites to the south**

Mr Brian Thomas, Technical Director commented "It is extremely encouraging that a review of historical surface soil sampling has identified a maximum of 960.1ppm TREO assay result which given these are soil samples and not rock chips, makes the numbers seem quite remarkable. The review, carried out by our in-house technical team has highlighted key areas of interest for follow up with an extensive gridded auger program prior to drilling. Using analogues to other major rare earth deposits, fenitisation is proving a very useful indicator for our exploration strategy and targeting for a primary source of the REE's. The discovery of KTA's ionic-clay REE's 60km to the southwest, and lithium bearing pegmatites recorded adjacent to the south, further highlights the prospectivity of the Mt Clere project and the eastern Gascoyne region."

Frontier Resources Ltd (ASX: FNT) (**Frontier** or the **Company**) is pleased to announce the results and interpretation of a historical data review completed at Mt Clere Rare Earths and Lithium Project in Western Australia (**Mt Clere Project**). The review identified multiple high priority targets within the Durlacher Supersuite lithology which hosts Hastings Technology Metals' (ASX:HAS) world-class Yangibana Mineral Resource³ of 27.42Mt @ 0.97% TREO with 0.33% Nd₂O₃+Pr₆O₁₁.

A field reconnaissance and sampling program was recently completed to inspect the target areas with a total of 17 rock chip samples to be sent to the ALS Laboratory, with assay results expected in May. An extensive gridded auger sampling program is planned across the broader project area to cover the remainder of the Durlacher Supersuite intrusives and key target areas identified from an extensive reinterpretation of open file geophysics and the historical geochemical data review.

The Mt Clere project comprises of one exploration licence application E52/4012 covering approximately 350km², located on the major Ti Tree Shear Zone which may be analogous to the relationship between the Lyons River Fault and the Gifford Creek Carbonatite Complex, host to Hastings Technology Metals Yangibana mine. Mt Clere is located along the northern margin of the Yarlalweelor Gneiss Belt, with major bodies of Proterozoic Durlacher Supersuite and Moorarie Supersuite granites also prospective for lithium bearing pegmatites. The review of publicly available data recorded fifty-one (51) pegmatites mapped across the Mt Clere Project area by the Geological Survey of Western Australia (GSWA). The surface extent and potential for these pegmatites to host lithium mineralisation will be a primary focus of initial work programs.

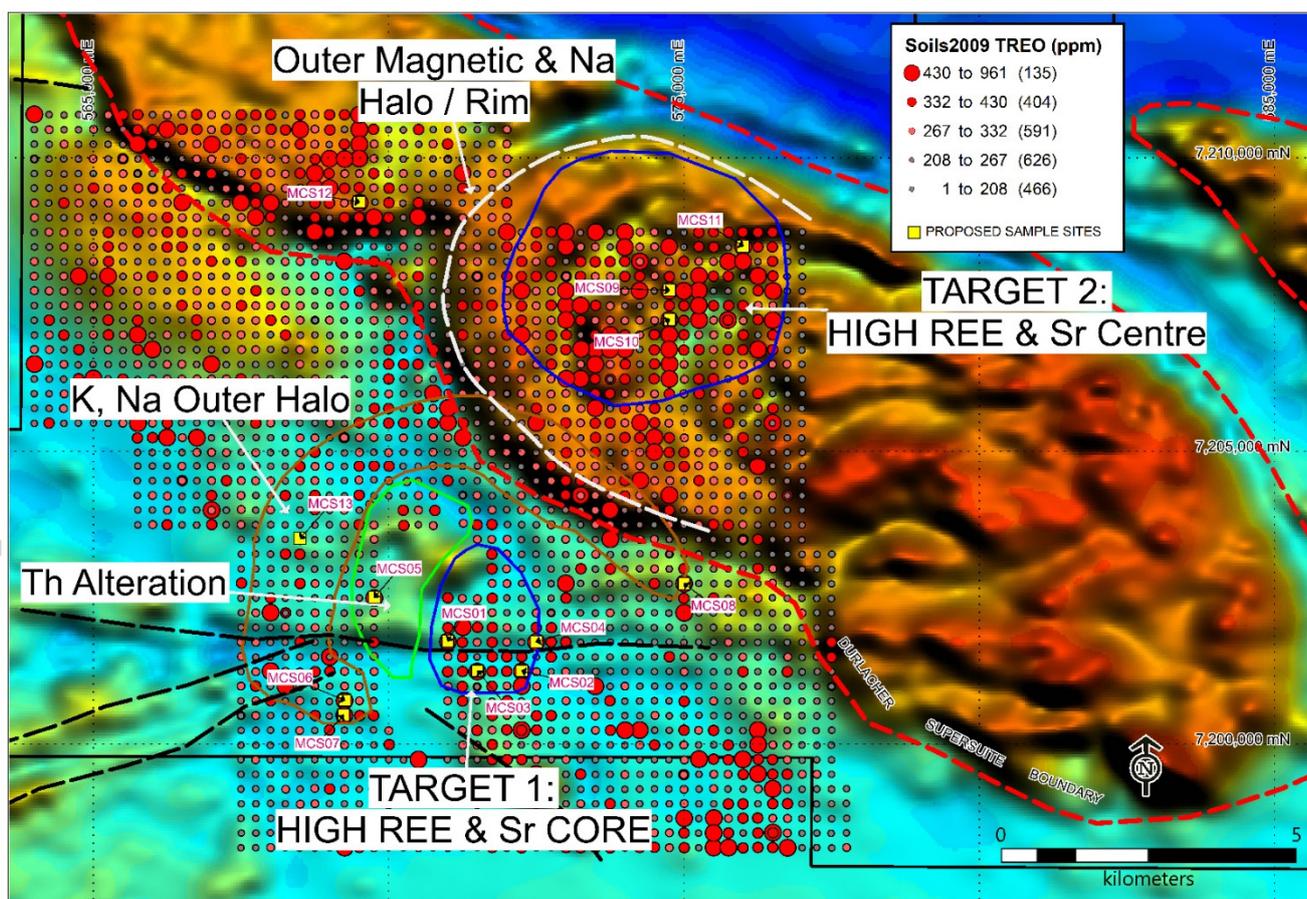

Figure 1. Mt Clere Project target areas 1 & 2 in the western half of the project, showing elevated total rare earths recorded in historical surface samples dataset on magnetics image.

Target 1 (Figure 1) is a high priority area for fenitic alteration leading to mobilisation of REE and Nb concentrations. It has a 1700m diameter inner core of anomalous REE (up to 737.2 ppm TREO) and associated Sr, with an outer potassic and sodic alteration halo (Figure 1). Follow-up auger sampling is recommended.

Target 2 has an anomalous centre of REE and Sr, an outer alteration halo of Na coincident with a magnetic rim, and inner anomalous potassium/potassic alteration. Anomalous REE and Niobium in soils have mobilised throughout this target area which is recommended for follow-up auger sampling and ground microgravity geophysical surveying.

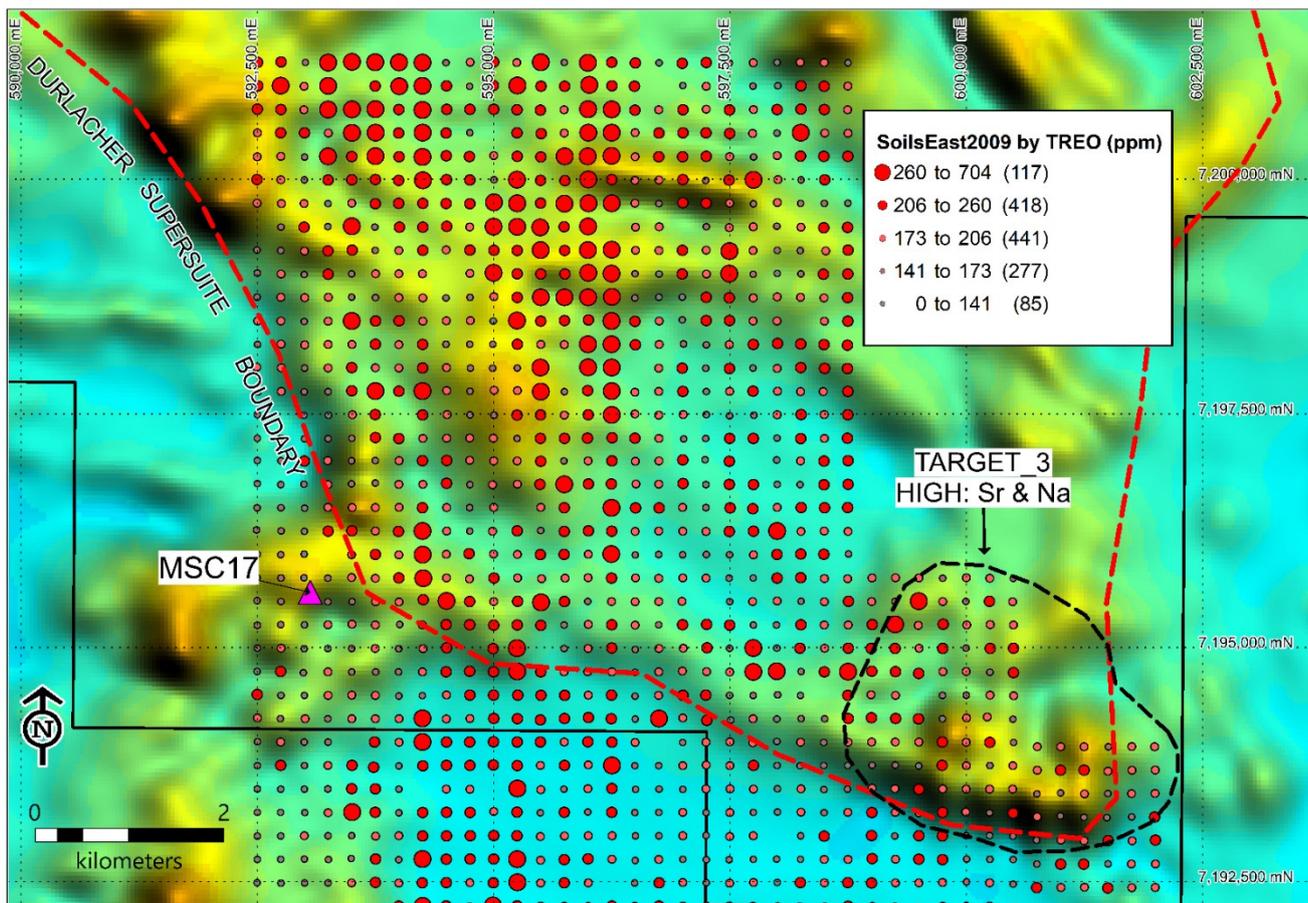

Figure 2. Mt Clere Project target area 3 in the eastern half of the project, showing elevated total rare earths recorded in historical surface samples dataset on magnetics image.

Target 3 occurs on the edge of the Durlacher Supersuite (Figure 2) which is anomalous in Sr along its magnetic boundary and Na which may indicate fenitic alteration and mobilisation of REE and Nb. Anomalous REE (up to 268.19 ppm) and Nb within this target area are recommended for further follow-up auger sampling and ground Microgravity surveying. Samples site MSC17 appears to have iron enrichment (Photo 1) and select samples will be sent in for mineralogy/SEM to help distinguish rock types.

For personal use only

Photo 1: Sample site of MSC17 which appears to have iron enrichment

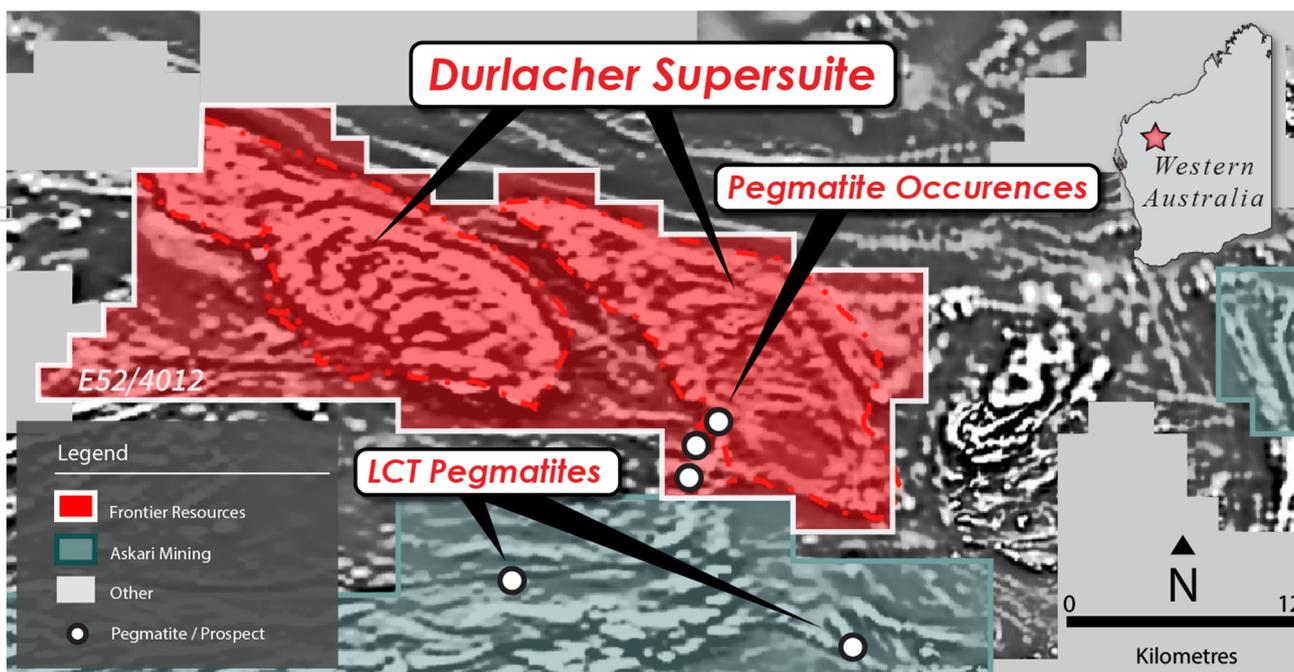

Figure 3. Mt Clere Project covering ~350km² of Durlacher Supersuite prospective for rare earths and lithium bearing pegmatites.

For personal use only

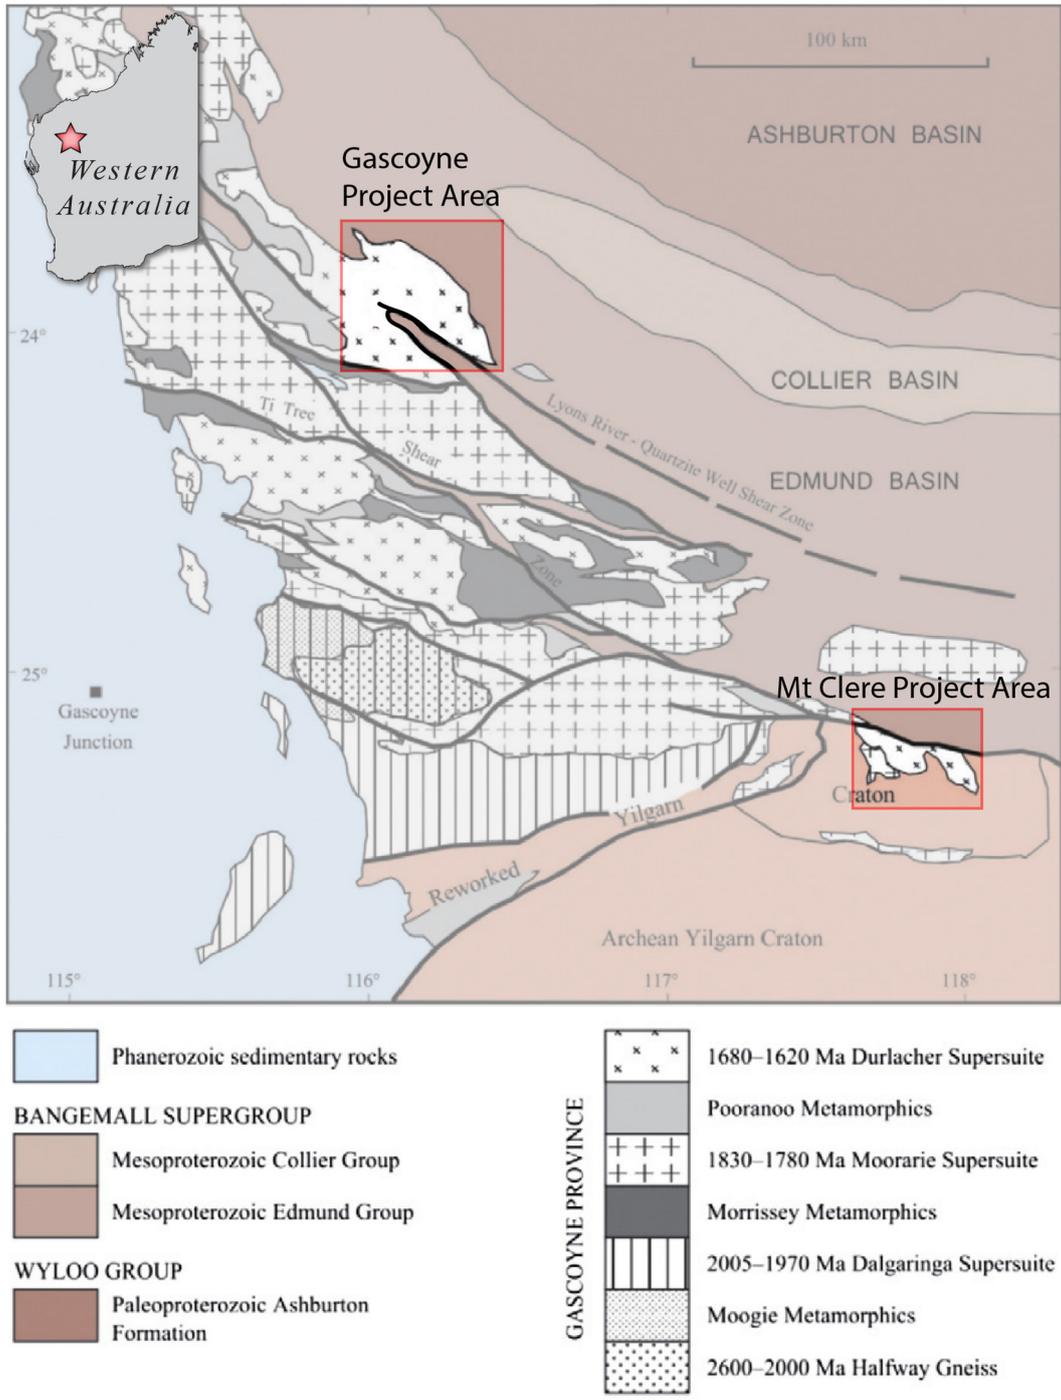

Figure 4. Regional geological setting of the Gascoyne Province, showing the two project areas Frontier Resources is exploring.

Future Work

Frontier will commence an extensive gridded surface sampling program as soon as possible designed to identify and validate the potential of rare earth elements and lithium mineralisation within the Mt Clere project area. Follow on exploration will depend on the results of this initial work program but are expected to include a detailed and systematic exploration program comprising of a combination of soil geochemical sampling, rock sampling and geophysical surveys across the high priority target areas, prior to drilling programs being undertaken.

This announcement has been authorised for release by the Directors of the Company.

Competent Person's Statement

The information in this document that relates to Exploration Results, Mineral Resources or Ore Reserves is based on information compiled by Mr. Thomas Langley who is a member of the Australian Institute of Geoscientists (MAIG) and a member of the Australasian Institute of Mining and Metallurgy (MAuslMM). Mr. Thomas Langley is a consultant of Frontier Resources Limited, and is a shareholder, however Mr. Thomas Langley believes this shareholding does not create a conflict of interest, and Mr. Langley has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the “Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves”. Mr. Langley consents to the inclusion in this presentation of the matters based on his information in the form and context in which it appears.

The Company confirms that it is not aware of any new information or data that materially affects the information in the original reports, and that the format and context in which the Competent Person's findings are presented have not been materially modified from the original reports.

Competent Person's Statement

The information in this report that relates to Geophysical Exploration Results is based on information compiled by Peter Swiridiuk - Member of the Australian Institute of Geoscientists. Peter Swiridiuk is a Technical Consultant and Non-Executive Director for Frontier Resources. Peter Swiridiuk has sufficient experience which is relevant to the type of mineralisation and type of deposit under consideration to qualify as Competent Person as defined in the 2012 Edition of the Australasian Code of Reporting Exploration Results, Mineral Resources and Ore Resources. Peter Swiridiuk consents to the inclusion in the report of the matters based on the information in the form and context in which it appears. Additionally, Mr Swiridiuk confirms that the entity is not aware of any new information or data that materially affects the information contained in the ASX releases referred to in this report.

Criteria	JORC Code explanation	Commentary
Drill hole Information	<ul style="list-style-type: none"> • A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: <ul style="list-style-type: none"> ○ easting and northing of the drill hole collar ○ elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar ○ dip and azimuth of the hole ○ down hole length and interception depth ○ hole length. • If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case. 	No drilling undertaken.
Data aggregation methods	<ul style="list-style-type: none"> • In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated. • Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. • The assumptions used for any reporting of metal equivalent values should be clearly stated. 	No drilling undertaken.
Relationship between mineralisation widths and intercept lengths	<ul style="list-style-type: none"> • These relationships are particularly important in the reporting of Exploration Results. • If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. • If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known'). 	No drilling undertaken.
Diagrams	<ul style="list-style-type: none"> • Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views. 	Refer to figures within this report.

Criteria	JORC Code explanation	Commentary
Balanced reporting	<ul style="list-style-type: none"> Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results. 	The accompanying document is a balanced report with a suitable cautionary note.
Other substantive exploration data	<ul style="list-style-type: none"> Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances. 	Suitable commentary of the geology encountered are given within the text of this document.
Further work	<ul style="list-style-type: none"> The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling). Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive. 	Further surface sampling programs (auger, soils and streams), detailed geophysical programs (airborne magnetic – radiometric, microgravity surveys), and mapping prior to drilling
