# NEW HIGH GRADE ASSAY RESULTS FROM CALLISTO

**Highlights**

- Assays from the current and ongoing RC drilling program confirm consistent high grade palladium mineralisation at the Callisto discovery
- Significant new drill intersections from the shallow discovery zone include;
  - 30 metres @ 2.08 g/t 3E <sup>(1)</sup> (1.69 g/t Pd, 0.30 g/t Pt, 0.09 g/t Au), 0.37% Cu & 0.34% Ni from 149m (NRC299) including
    - 6 metres @ 3.13 g/t 3E (2.54 g/t Pd, 0.44 g/t Pt, 0.14 g/t Au), 0.63% Cu & 0.51% Ni from 171m
  - 30 metres @ 1.88 g/t 3E (1.55 g/t Pd, 0.25 g/t Pt, 0.08 g/t Au), 0.32% Cu & 0.32% Ni from 152m (NRC300)
  - 21 metres @ 1.41 g/t 3E (1.15 g/t Pd, 0.20 g/t Pt, 0.06 g/t Au), 0.22% Cu & 0.26% Ni from 138m (NRC298)
  - 27 metres @ 1.21 g/t 3E (1.01 g/t Pd, 0.16 g/t Pt, 0.04 g/t Au), 0.18% Cu & 0.23% Ni from 191m (NRC303) and
    - 8 metres @ 1.39 g/t 3E (1.15 g/t Pd, 0.20 g/t Pt, 0.03 g/t Au), 0.09% Cu & 0.23% Ni from 154m
- Mineralisation continues to be open along strike and down dip to the east where diamond drilling is continuing
- 8,600 metres of RC drilling and 1,400 metres of diamond drilling completed in the current ongoing programs
- Assays are pending for all diamond drill holes including the massive sulphide intersection <sup>(2)</sup> with the first diamond core results expected in two to four weeks

**Galileo Mining Ltd** (ASX: GAL, "Galileo" or the "Company") is pleased to announce drill assays from the ongoing RC drill program at the Callisto palladium-platinum-gold-rhodium-copper-nickel discovery within the Company's 100% owned Norseman project in Western Australia.

(1) 3E = Palladium (Pd) + Platinum (Pt) + Gold (Au); expressed in g/t. See Appendix 1 for details.

(2) See Galileo ASX Announcement dated 29<sup>th</sup> August 2022 for further details.

Galileo's Managing Director Brad Underwood commented; *"Today's results again confirm the extensive nature of palladium and associated metals at the Callisto discovery. Assay results from a further four drill holes each returned consistent palladium grades over greater than 20 metre thickness with every palladium zone accompanied by platinum, gold, copper, and nickel. We are also seeing copper and nickel zones in NRC299 above 0.6% and 0.5% respectively. This is a great sign for the potential development of even higher-grade zones particularly where we have previously encountered massive sulphides <sup>(2)</sup>.*

*New mineral discoveries present a tremendous opportunity in the early stages of exploration and we believe Callisto is no exception. Drilling will provide us the data we need to understand the mineralisation and to trace out any high-grade zones along strike and at depth. We have a lot to learn about the overall mineralised system and the opportunities that may present themselves as we continue with our large-scale drill campaigns."*

Two rigs (one RC and one diamond drill) are continuing to drill at the Callisto discovery where Galileo recently made a major palladium-platinum-gold-copper-nickel discovery (see ASX announcement dated 11<sup>th</sup> May 2022). Subsequent assay results have shown the sulphide mineralisation at Callisto is accompanied by the high value precious metal rhodium (see ASX announcements dated 27<sup>th</sup> May 2022 and 4<sup>th</sup> August 2022). Rhodium assaying of sulphide zones is progressing with a separate analytical technique used to quantify rhodium after the initial Pd-Pt-Au-Cu-Ni results. The results reported above will ultimately be updated to include rhodium when laboratory assays become available.

**Figure 1 — RC drilling on site at Galileo's 100% owned Callisto discovery near Norseman.**

Figure 2 — Callisto geological interpretation section 6,447,950N with major drill intercepts. Assays pending for all diamond drill tails (NRC301, NRC302, NRC305, NRC306). NRC304 yet to be drilled with diamond tail.

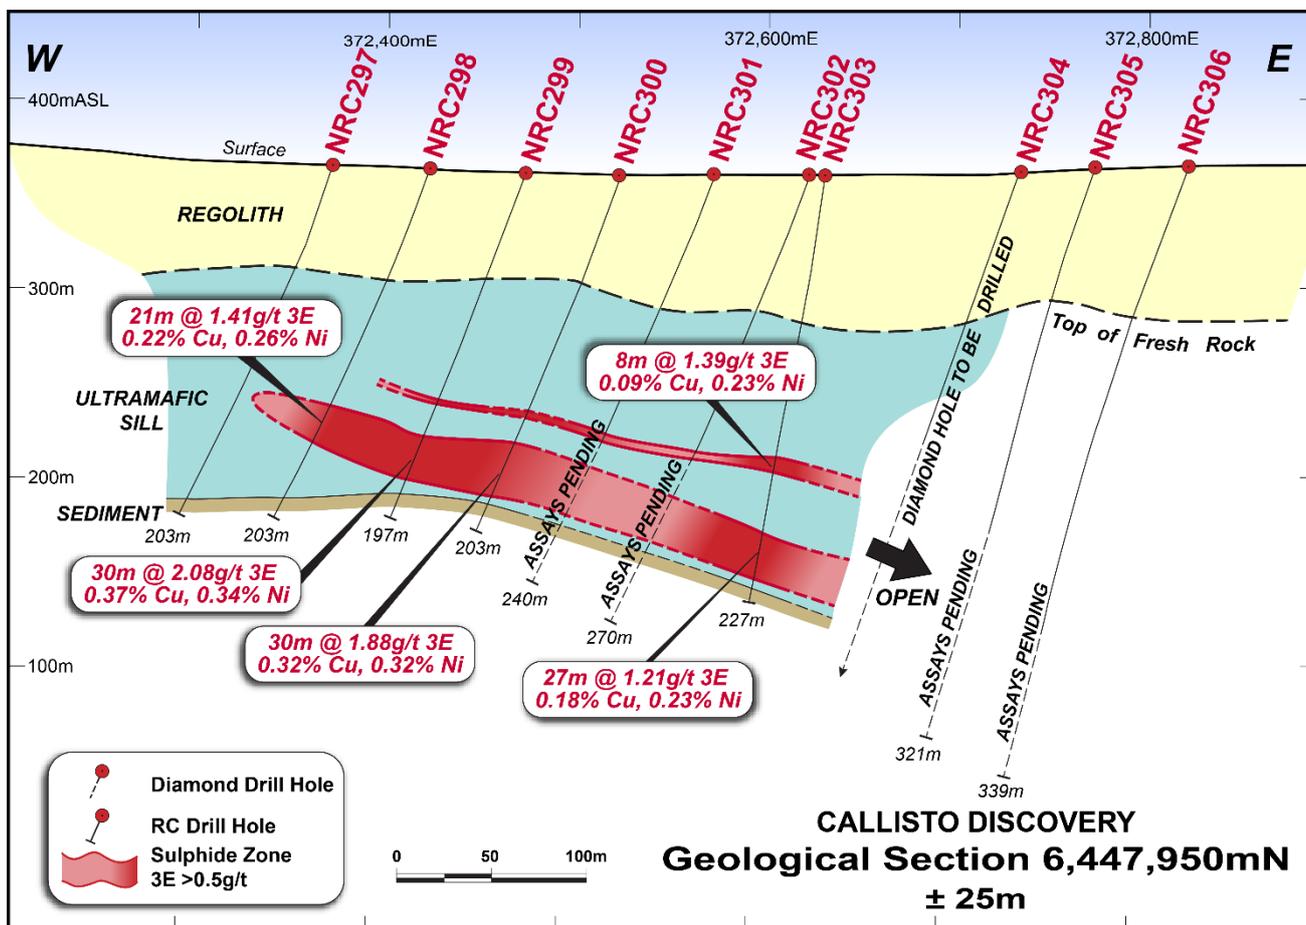

Figure 2 shows the section of reported drill holes with the map in Figure 3 showing the section line in plan view relative to previous drilling. Assays from the diamond core drill tails shown in Figure 2 are currently pending along with multiple other drill holes. To date approximately 1,400 metres of diamond core drilling (all as drill tails) has been completed at Callisto. Assay results for diamond core are dependent on laboratory turnaround times with current expectations that the first diamond core assays will be available in late September to October. Approximately 8,600 metres of RC drilling has been undertaken since the current round of RC drilling began in August with the vast majority of assay results still outstanding.

Of note in the Figure 2 section is the development of a new “seam” of PGE-Cu-Ni within the ultramafic rock above the lower zone. This mineralisation is consistent between drill holes at a 0.5 g/t 3E cut-off and peaks at 8m @ 1.39 g/t 3E in NRC303 where it dips shallowly to the east. The significance of this particular new zone will depend on the assay results from down-dip drill holes (NRC304, NRC305, NRC306). However, as a generalisation, the observation of new and distinct mineralised units within the large ultramafic sill is a positive development for the prospectivity of the overall five-kilometre-long host rock target zone. This is because the

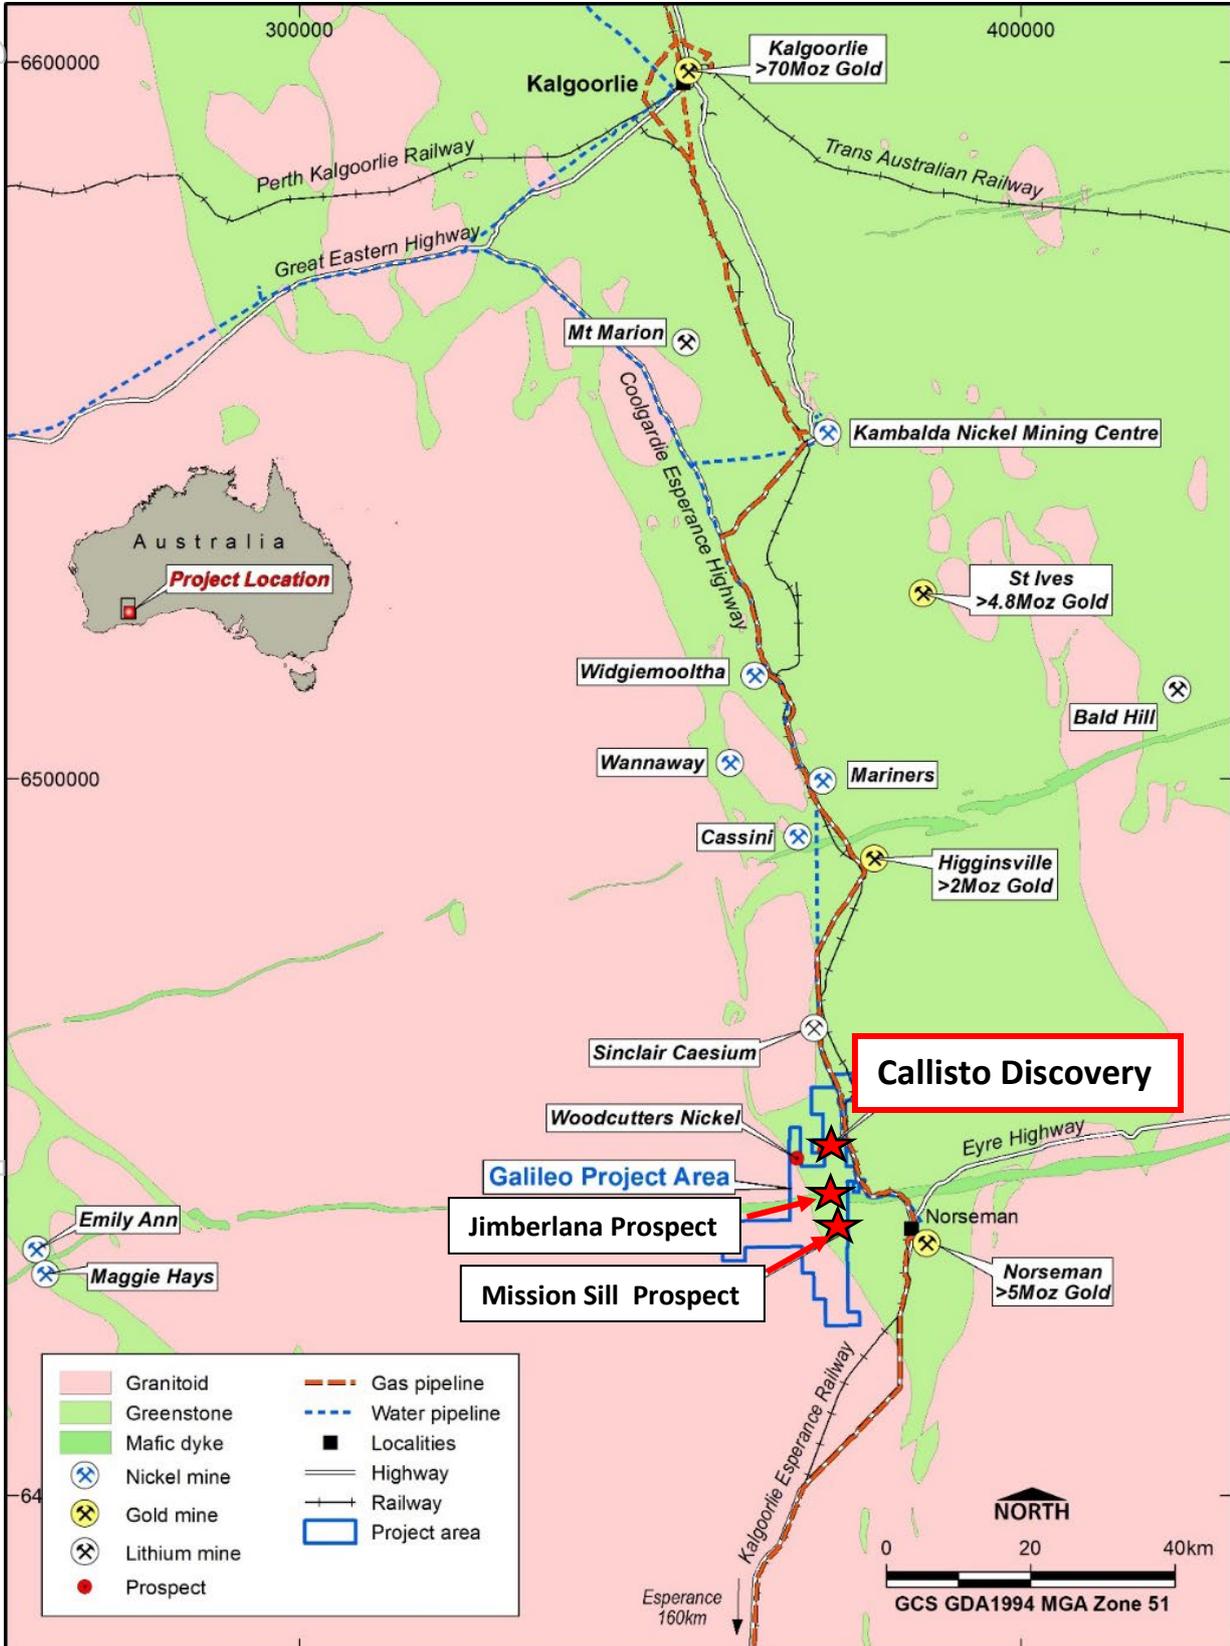

host rock is demonstrating that it can accommodate multiple mineralised units adjacent to, and at some distance from, the underlying sedimentary rock unit.

Figure 3 shows a plan view of the drilling undertaken to date for programs conducted earlier in the year and for the current ongoing RC and diamond core drill programs. Appendices 1 and 2 contain the drill hole details for the current assay release.

**Figure 3 — Plan map of drilling with 6,447,950N section line (Figure 2). RC and diamond drill target zones around known sulphide mineralisation for the current drill campaigns are shown (dotted ellipses). Regional RC drilling up to one kilometre away from existing drill holes (off plan to the north) is also scheduled within the current RC program.**

Figure 4 – Norseman project location map with a selection of regional mines and infrastructure

### Competent Person Statement

The information in this report that relates to Exploration Results is based on, and fairly represents, information and supporting documentation prepared by Mr Brad Underwood, a Member of the Australasian Institute of Mining and Metallurgy, and a full time employee of Galileo Mining Ltd. Mr Underwood has sufficient experience that is relevant to the styles of mineralisation and types of deposit under consideration, and to the activity being undertaken, to qualify as a Competent Person as defined in the 2012 Edition of the “Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves” (JORC Code). Mr Underwood consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

With regard to the Company’s ASX Announcements referenced in the above Announcement, the Company is not aware of any new information or data that materially affects the information included in the Announcements.

**Authorised for release by the Galileo Board of Directors.**

**About Galileo Mining:**

Galileo Mining Ltd (ASX: GAL) is focussed on the exploration and development of palladium, nickel, copper, and cobalt resources in Western Australia. GAL’s tenements near Norseman are highly prospective for palladium-copper-nickel sulphide deposits as shown by the Callisto discovery. GAL also has Joint Ventures with the Creasy Group over tenements in the Fraser Range which are prospective for nickel-copper sulphide deposits similar to the operating Nova mine. GAL’s Norseman Project contains a near surface laterite deposit with over 26,000 tonnes of contained cobalt, and 122,000 tonnes of contained nickel, in JORC compliant resources (see JORC Table below).

*JORC Mineral Resource Estimates for the Norseman Cobalt Project (“Estimates”) (refer to ASX “Prospectus” announcement dated May 25<sup>th</sup> 2018 and ASX announcement dated 11<sup>th</sup> December 2018, accessible at <http://www.galileomining.com.au/investors/asx-announcements/>). Galileo confirms that all material assumptions and technical parameters underpinning the Estimates continue to apply and have not materially changed).*

**Galileo Mining Ltd – Norseman Project**  
**JORC Code, 2012 Edition – Table 1**

**Section 1 Sampling Techniques and Data**

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	<ul style="list-style-type: none"> <li>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</li> <li>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</li> <li>Aspects of the determination of mineralisation that are Material to the Public Report.</li> <li>In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules)</li> </ul>	<ul style="list-style-type: none"> <li>Reverse Circulation (RC) drilling was used to obtain one metre individually bagged chip samples.</li> <li>Each RC bag was spear sampled to provide a 4-metre representative composite sample for analyses.</li> <li>A 1m sample split for each metre is collected at the time of drilling from the drill rig mounted cone splitter.</li> <li>Selected 1m split sample intervals were selected from zones of interest and sent to the laboratory for analysis with remainder of drill hole assayed using 4m composite samples.</li> <li>QAQC standards (blank &amp; reference) and duplicate samples were included routinely with 1 per 20 samples being a standard or duplicate.</li> <li>Samples were sent to an independent commercial assay laboratory.</li> <li>All assay sample preparation</li> </ul>

Criteria	JORC Code explanation	Commentary
	<i>may warrant disclosure of detailed information.</i>	<p>comprised oven drying, pulverising and splitting to a representative assay charge pulp.</p> <ul style="list-style-type: none"> <li>• A 50g Lead Collection Fire Assay with ICP-MS finish is used to determine Au, Pt and Pd results.</li> <li>• A four acid digest is used for sample digest with a 48 element analysis suite including Ag, Al, As, Ba, Be, Bi, Ca, Cd, Ce, Co, Cr, Cs, Cu, Fe, Ga, Ge, Hf, In, K, La, Li, Mg, Mn, Mo, Na, Nb, Ni, P, Pb, Rb, Re, S, Sb, Sc, Se, Sn, Sr, Ta, Te, Th, Ti, Tl, U, V, W, Y, Zn, Zr by ICP-OES finish.</li> <li>• Sampling and assaying of diamond core has yet to occur</li> </ul>
<i>Drilling techniques</i>	<ul style="list-style-type: none"> <li>• <i>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i></li> </ul>	<ul style="list-style-type: none"> <li>• RC drilling was undertaken by Core Drilling Services using a 5.5" face sampling drill bit.</li> <li>• Diamond core drilling was undertaken using NQ2 core (50.6mm diameter) completed by Terra Drilling Pty Ltd.</li> <li>• All core holes were surveyed during drilling using a CHAMP north seeking gyro tool.</li> <li>• All RC holes were surveyed during drilling using a GyroMaster north seeking gyro tool</li> </ul>
<i>Drill sample recovery</i>	<ul style="list-style-type: none"> <li>• <i>Method of recording and assessing core and chip sample recoveries and results assessed.</i></li> <li>• <i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i></li> <li>• <i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i></li> </ul>	<ul style="list-style-type: none"> <li>• RC sample recoveries are visually estimated for each metre with poor or wet samples recorded in drill and sample log sheets.</li> <li>• NQ diamond core drilling recoveries were estimated for each interval by logging the length of the sample recovered against the reference (orientation) line. Recoveries were all greater than 90% and typically 100%.</li> <li>• The sample cyclone was routinely cleaned at the end of each 6m rod and when deemed necessary.</li> <li>• No relationship has been determined between sample recoveries and grade and there is insufficient data to determine if there is a sample bias.</li> </ul>
<i>Logging</i>	<ul style="list-style-type: none"> <li>• <i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i></li> <li>• <i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i></li> </ul>	<ul style="list-style-type: none"> <li>• Geological logging of RC drill holes was done on a visual basis with logging including lithology, grainsize, mineralogy, texture, deformation, mineralisation, alteration, veining, colour and weathering.</li> <li>• Logging of RC drill chips is qualitative and based on the presentation of</li> </ul>

Criteria	JORC Code explanation	Commentary
	<ul style="list-style-type: none"> <li><i>The total length and percentage of the relevant intersections logged.</i></li> </ul>	<ul style="list-style-type: none"> <li>representative drill chips retained for all 1m sample intervals in the chip trays.</li> <li>Logging of the drill core is qualitative and based on the in-situ presentation of the core sample with down-hole depths measured against the reference (orientation) line.</li> <li>All RC drill holes were logged in their entirety</li> <li>Detailed logging of diamond core holes is ongoing</li> </ul>
Sub-sampling techniques and sample preparation	<ul style="list-style-type: none"> <li><i>If core, whether cut or sawn and whether quarter, half or all core taken.</i></li> <li><i>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</i></li> <li><i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i></li> <li><i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i></li> <li><i>Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</i></li> <li><i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i></li> </ul>	<ul style="list-style-type: none"> <li>All assays reported are from 1m cone split samples.</li> <li>1m cone split samples were collected for all metres at the time of drilling from the drill rig mounted cone splitter.</li> <li>Selected 1m cone split samples for intervals deemed of interest by the geologist supervising the drill rig were submitted for priority assay.</li> <li>The samples are dried and pulverised before analysis.</li> <li>QAQC reference samples and duplicates are routinely submitted with each batch.</li> <li>The sample size is considered appropriate for the mineralisation style, application and analytical techniques used.</li> <li>Diamond core assaying is pending</li> </ul>
Quality of assay data and laboratory tests	<ul style="list-style-type: none"> <li><i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i></li> <li><i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i></li> <li><i>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</i></li> </ul>	<ul style="list-style-type: none"> <li>RC Chip samples are analysed for a multielement suite (48 elements) by ICP-OES following a four-acid digest. Assays for Au, Pt, Pd are completed by 50gram Fire Assay with an ICP-MS finish. The assay methods used are considered appropriate.</li> <li>QAQC standards and duplicates are routinely included at a rate of 1 per 20 samples</li> <li>Further internal laboratory QAQC procedures included internal batch standards and blanks</li> <li>Sample preparation was completed at Intertek Genalysis Laboratory, (Kalgoorlie) with digest and assay conducted by Intertek-Genalysis Laboratory Services (Perth) using a four acid (4A/MS48) for multi-element assay and 50gram Fire Assay with an ICP-MS finish for Au, Pt, Pd, (FA50/MS).</li> <li>Diamond core has yet to be assayed.</li> <li>A Niton portable handheld XRF (pXRF)</li> </ul>

Criteria	JORC Code explanation	Commentary
		has been used only to assist field logging and as a guide for sample selection. No pXRF values are reported.
Verification of sampling and assaying	<ul style="list-style-type: none"> <li>• The verification of significant intersections by either independent or alternative company personnel.</li> <li>• The use of twinned holes.</li> <li>• Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</li> <li>• Discuss any adjustment to assay data.</li> </ul>	<ul style="list-style-type: none"> <li>• Field data is collected on site using a standard set of logging templates entered directly into a laptop computer. Data is then sent to the Galileo database manager (CSA Global - Perth) for validation and upload into the database.</li> <li>• Assays are as reported from the laboratory and stored in the Company database and have not been adjusted in any way.</li> </ul>
Location of data points	<ul style="list-style-type: none"> <li>• Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</li> <li>• Specification of the grid system used.</li> <li>• Quality and adequacy of topographic control.</li> </ul>	<ul style="list-style-type: none"> <li>• Drill hole collars are surveyed with a handheld GPS with an accuracy of +/- 5m which is considered sufficient for drill hole location accuracy.</li> <li>• Co-ordinates are in GDA94 datum, Zone 51.</li> <li>• Downhole depths are in metres from surface.</li> <li>• Topographic control has an accuracy of 2m based on detailed satellite imagery derived DTM or on laser altimeter data collected from aeromagnetic surveys</li> </ul>
Data spacing and distribution	<ul style="list-style-type: none"> <li>• Data spacing for reporting of Exploration Results.</li> <li>• Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</li> <li>• Whether sample compositing has been applied.</li> </ul>	<ul style="list-style-type: none"> <li>• Drill hole spacing for the RC and diamond core drill holes was approximately 50m. The holes were placed to target potential mineralisation as indicated by previous drilling and geological interpretation.</li> <li>• Drill spacing is insufficient for the purposes of Mineral Resource estimation.</li> <li>• RC drill holes were sampled from surface on a 4m composite basis or as 1m, 2m, or 3m samples as determined by the end of hole depth or under instruction from the geologist supervising the program.</li> <li>• 1m cone split RC samples were collected through zones of geological interest.</li> <li>• Diamond core drill holes will be sampled over the selected logged zones of interest</li> </ul>
Orientation of data in relation to	<ul style="list-style-type: none"> <li>• Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</li> </ul>	<ul style="list-style-type: none"> <li>• It is unknown whether the orientation of sampling achieves unbiased sampling as interpretation of quantitative measurements of</li> </ul>

Criteria	JORC Code explanation	Commentary
geological structure	<ul style="list-style-type: none"> <li>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</li> </ul>	<p>mineralised zones/structures has not yet been completed.</p> <ul style="list-style-type: none"> <li>The drilling is oriented either perpendicular to the regional lithological strike and dip or as holes adjacent to previous aircore drilling.</li> </ul>
Sample security	<ul style="list-style-type: none"> <li>The measures taken to ensure sample security.</li> </ul>	<ul style="list-style-type: none"> <li>Each sample was put into a tied off calico bag and then several placed in large plastic "polyweave" bags which were zip tied closed.</li> <li>Samples were delivered directly to the laboratory in Kalgoorlie by Galileo staff.</li> </ul>

Criteria	JORC Code explanation	Commentary
		<p>correlation cited as support for magmatic rather than hydrothermal PGE source.</p> <p>AGR (2003-2004)</p> <ul style="list-style-type: none"> <li>• Soil sampling over the Mission Sill and Jimberlana Dyke.</li> <li>• RC drilling (MTRC036-052) confirmed shallow PGE anomalism with best results of 1m at 2.04 combined Pt-Pd in MTRC038 from surface.</li> <li>• Petrography identified sulphide textures indicative of primary magmatic character.</li> <li>• Sixty samples were re-assayed for PGE when assays returned &gt;0.05% Cu. A further 230 samples were re-assayed based on the initial Au-Pd-Pt results. The best combined result for Au-Pd-Pt was 5.7g/t.</li> </ul> <p>Galileo</p> <ul style="list-style-type: none"> <li>• Galileo commenced exploration on the Norseman Project from 30th June 2004 after sale of the tenements by AGR.</li> </ul>
Geology	<ul style="list-style-type: none"> <li>• <i>Deposit type, geological setting and style of mineralisation.</i></li> </ul>	<ul style="list-style-type: none"> <li>• The Norseman target geology and mineralisation style is nickel-copper-PGE mineralisation related to layered intrusions and komatiite nickel sulphide mineralisation occurring within the GSWA mapped Mount Kirk Formation</li> <li>• The Mount Kirk formation is described as “Acid and basic volcanic rocks and sedimentary rocks, intruded by basic and ultrabasic rocks”</li> </ul>
Drill hole Information	<ul style="list-style-type: none"> <li>• <i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</i> <ul style="list-style-type: none"> <li>○ <i>easting and northing of the drill hole collar</i></li> <li>○ <i>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</i></li> <li>○ <i>dip and azimuth of the hole</i></li> <li>○ <i>down hole length and interception depth</i></li> <li>○ <i>hole length.</i></li> </ul> </li> <li>• <i>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</i></li> </ul>	<ul style="list-style-type: none"> <li>• Refer to Appendices 1 and 2.</li> </ul>

Criteria	JORC Code explanation	Commentary
Data aggregation methods	<ul style="list-style-type: none"> <li>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</li> <li>Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</li> <li>The assumptions used for any reporting of metal equivalent values should be clearly stated.</li> </ul>	<ul style="list-style-type: none"> <li>Tables of relevant assay intervals of significance are included in previous releases.</li> <li>Parts-per-billion and parts-per-million data reported from the assay laboratory have been converted to grams-per-tonne for Au, Pd, Pt.</li> <li>Parts-per-million data reported from the assay laboratory for Cu and Ni have been converted to percent values and reported as percent values rounded to 2 decimal places. 3E intercepts have been calculated as the sum of Au, Pd and Pt assays in grams-per-tonne rounded to 2 decimal places.</li> <li>The reported significant intercepts are calculated using a lower cut of 0.5g/t 3E, minimum width of 3 metres, no internal dilution, and include the corresponding interval intercept for Pd, Pt, Au, Cu and Ni</li> </ul>
Relationship between mineralisation widths and intercept lengths	<ul style="list-style-type: none"> <li>These relationships are particularly important in the reporting of Exploration Results.</li> <li>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</li> <li>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').</li> </ul>	<ul style="list-style-type: none"> <li>The drilling is oriented approximately perpendicular to the regional lithological strike and dip</li> <li>It is unknown whether the orientation of sampling achieves unbiased sampling of possible structures as no measurable structures are recorded in drill chips.</li> <li>No quantitative measurements of mineralised zones/structures exist, and all drill intercepts are reported as down hole length in metres, true width unknown.</li> </ul>
Diagrams	<ul style="list-style-type: none"> <li>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</li> </ul>	<ul style="list-style-type: none"> <li>Project location map and plan map of the drill hole locations with respect to each other and with respect to other available data are included in the text.</li> <li>Drill hole locations have been determined with hand-held GPS drill hole collar location (Garmin GPS 78s) +/- 5m in X/Y/Z dimensions</li> </ul>
Balanced reporting	<ul style="list-style-type: none"> <li>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</li> </ul>	<ul style="list-style-type: none"> <li>All available relevant information is presented.</li> </ul>

Criteria	JORC Code explanation	Commentary
Other substantive exploration data	<ul style="list-style-type: none"> <li>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</li> </ul>	<ul style="list-style-type: none"> <li>Detailed 50m line spaced aeromagnetic data has been used for interpretation of underlying geology. Data was collected by Magspec Airborne Surveys Pty Ltd using a Geometrics G-823 caesium vapor magnetometer at an average flying height of 30m.</li> <li>28 lines (for 657 stations) of 200m or 400m line x 100m station spaced Moving Loop Electromagnetic survey data was collected over the prospect using a 200m loop. Data was collected using a Smartem receiver and Fluxgate receiver coil at base frequencies of 1.0Hz to 0.25Hz and 28-30 Amp current. Two conductor plates were modelled. Based on the available drill logs these conductors appear to represent the position of sulphide rich sediment beneath the target mafic-ultramafic intrusion.</li> </ul>
Further work	<ul style="list-style-type: none"> <li>The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).</li> <li>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</li> </ul>	<ul style="list-style-type: none"> <li>Ongoing RC and diamond core drilling</li> <li>Laboratory assaying</li> </ul>
