

21 April 2023

# New Ironstone Trends at Lyons Project

- **New Ironstones trends discovered with the potential to host REE mineralisation outcropping at surface (Figure 1 & 2)**
- **Rockchips sent for priority analysis**
- **High resolution ground magnetic survey recently completed**
- **Interpretation of magnetic survey results is continuing with preliminary results demonstrating the significance of 3D modelling of anomalies (Figure 4)**
- **Drilling targeting Fenitisation containing enriched zones of REE and Niobium (Nb<sub>2</sub>O<sub>5</sub>) along the outer rim of the regionally significant sized carbonatite complexes**
- **Two diamond holes jointly funded under DMIRS EIS scheme to be drilled into deeper carbonatite targets in early May**
- **RC drilling programme (>10,000m) planned to commence in the coming days targeting large scale carbonatite targets and high-grade Ironstones**
- **Geological team mobilised to site in preparations for drilling programs and site works for drill access underway**

Mr Brian Thomas, Lanthanein Technical Director commented *“The identification of new outcropping ironstone trends is extremely positive with these rock chips being sent for priority analysis in Perth with results expected in the next few weeks. The new discoveries are especially pleasing as they are the result of the geological team’s growing understanding of the rare earth mineralisation controls within the Gifford Creek Carbonatite complex. The upcoming field programs are extremely exciting as we position ourselves to make a breakthrough discovery that could potentially transform the Company. We look forward to building on the discoveries made to date with the high grade outcropping ironstones at Lyons 12, 13 & 27 which are ~2km from Hastings Technology Metals (ASX:HAS) Frasers and Simons Find pits and updating the market with results as drilling progresses.”*

**Figure 3. Lanthanein Resources Lyons and Edmund Projects located within close proximity of Dreadnought Resources Yin discovery and Hastings Technology Metals Yangibana REE mine.**

**Lanthanein Resources Ltd (ASX: LNR) (Lanthanein or the Company)** is pleased to announce a recent reconnaissance rock chip sampling program has identified additional outcropping ironstones that may host REE mineralisation in the most western area of the project area at the Lyons Rare Earths Project in Western Australia (**Lyons Project**), Figure 1. Rock chip samples will be sent to ALS Laboratories for priority analysis, with results expected in May. An extensive RC drill program consisting of >10,000m will commence shortly, targeting large scale Carbonatite intrusive targets and high-grade ironstones as previously discovered at Lyons 11, 12, 13 and 27 (Figures 3 and 5).

To ensure drillholes are targeted on the highest resolution magnetic geophysical information possible, an independent consulting group Resource Potentials recently completed a programme of ground magnetic surveying over five different areas targeted for drill testing. Interpretation of these results are continuing, and preliminary results (Figure 4) demonstrate the significance of 3D modelling the high-resolution data to best locate both the two diamond EIS holes and other RC drillholes. This drilling will initially test for Fenitisation containing enriched zones of REE and Niobium ( $Nb_2O_5$ ) along the outer rim of the regionally significantly sized carbonatite complexes.

The Company received approval for \$200,000 in co-funding from the Department of Mines Industry Regulation and Safety (DMIRS) in Round 26 of the Exploration Incentive Scheme (EIS) to investigate potential for large tonnage REE carbonatites similar to Lynas Corporation's Mount Weld deposit in Western Australia.

Two drill holes to 450m depth are proposed the test the outer magnetic rim of two of the larger carbonatite intrusives including LI-03 at 3km diameter and LI-01 at 4km diameter (Figure 5). Fenitic alteration (including magnetite and Th) are found to be associated with the outer rim of these intrusive bodies.

For personal use only

Further rock chip sampling, high resolution satellite spectral interpretation and drilling programs are planned to investigate additional targets not yet followed up, including thorium and magnetic anomalies throughout the Lyons Project and the high priority structural target along the major Bald Hill lineament which transects both the Edmund and Lyons Project Areas (Figure 3).

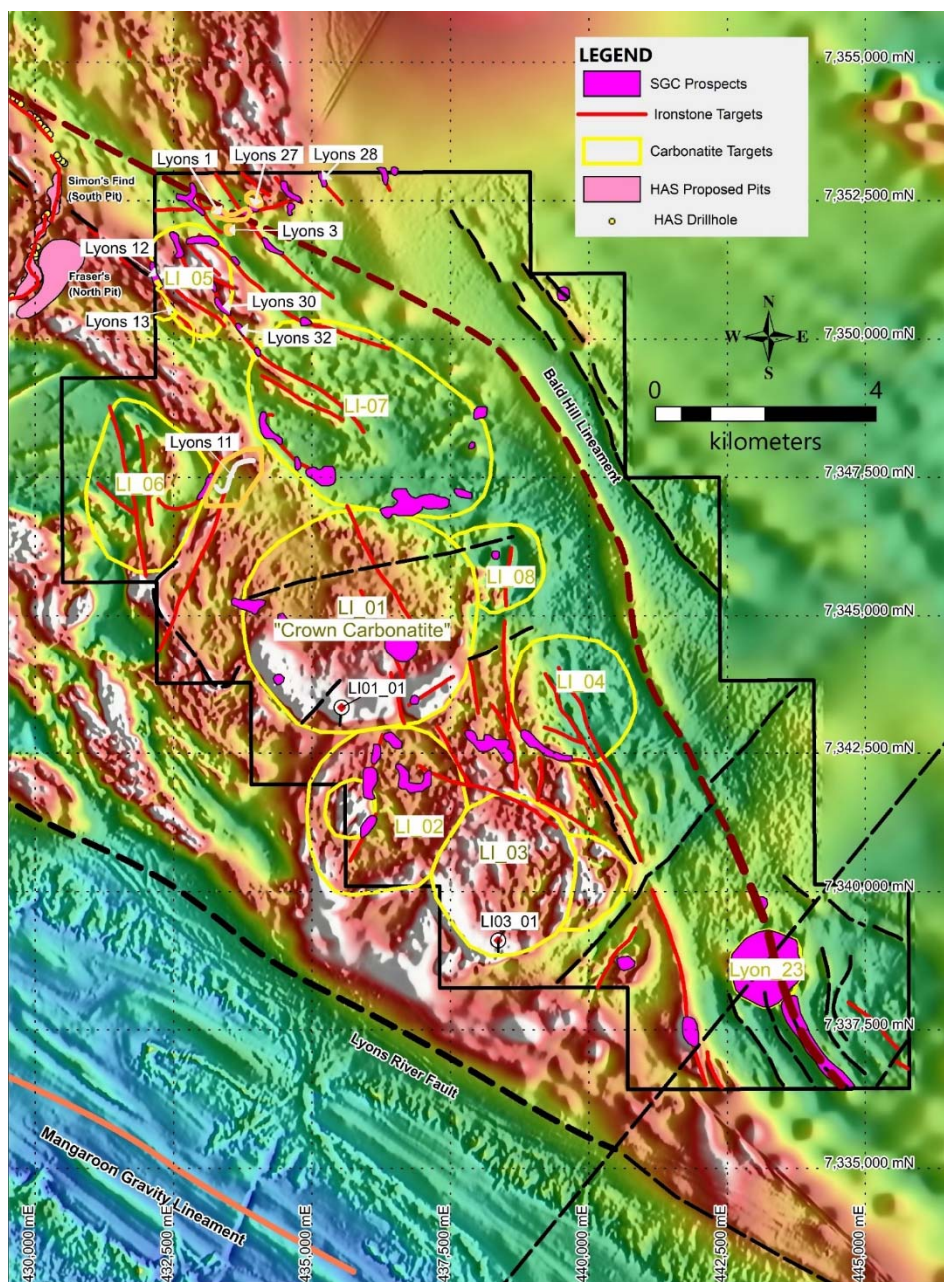

The Bald Hill lineament is the major control on rare earth mineralisation at Hastings Technology Metals Yangibana mine and represents a very high priority target for Lanthanein. Potential remains for further discoveries of ironstones and carbonatites within the Company's tenure where no historical REE exploration has occurred.

Carbonatites are becoming increasingly important due to potential to host economic quantities of Th, U, Nb, P, Y and rare earth elements, which are strategically important for modern technology. Within the Lyons Block and along the Bald Hill Lineament, numerous carbonatite intrusions have been modelled from the airborne magnetics (Figure 5) with a similar dimension to the Mt. Weld carbonatite.

**Figure 4. Interpreted 3D magnetic model of ground magnetic data and proposed drill site at LI01\_01.**

The Company confirms that it is not aware of any new information or data that materially affects the information in the original reports, and that the format and context in which the Competent Person's findings are presented have not been materially modified from the original reports.

**Competent Person's Statement**

The information in this document that relates to Exploration Results, Mineral Resources or Ore Reserves is based on information compiled by Mr. Thomas Langley who is a member of the Australian Institute of Geoscientists (MAIG) and a member of the Australasian Institute of Mining and Metallurgy (MAusIMM). Mr. Thomas Langley is a consultant of Lanthanein Resources Limited, and is a shareholder, however Mr. Thomas Langley believes this shareholding does not create a conflict of interest, and Mr. Langley has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves". Mr. Langley consents to the inclusion in this presentation of the matters based on his information in the form and context in which it appears.

**Competent Person's Statement**

The information in this report that relates to Geophysical Exploration Results is based on information compiled by Peter Swiridiuk - Member of the Aust. Inst. of Geoscientists. Peter Swiridiuk is a Technical Consultant and Non-Executive Director for Lanthanein Resources. Peter Swiridiuk has sufficient experience which is relevant to the type of mineralisation and type of deposit under consideration to qualify as Competent Person as defined in the 2012 Edition of the Australasian Code of Reporting Exploration Results, Mineral Resources and Ore Resources. Peter Swiridiuk consents to the inclusion in the report of the matters based on the information in the form and context in which it appears. Additionally, Mr Swiridiuk confirms that the entity is not aware of any new information or data that materially affects the information contained in the ASX releases referred to in this report.
